ABSTRACT

This thesis investigates how perceptions of military opportunities affect the intentions of racial/ethnic minorities to remain in the U.S. Navy. The study uses responses of Navy personnel on the 1996 Armed Forces Equal Opportunity Survey to assess minority perceptions of equal opportunity. Logistic regression models are developed for male and female enlisted personnel and officers to determine the relationship between perceptions that opportunities are better in the military and the decision to stay on active duty or leave the Navy. The results of the quantitative analysis show that the positive perceptions about training opportunities and quality of life were significant most often, across all racial/ethnic groups and models. Further, the results show that, among racial/ethnic groups, blacks were most strongly influenced by perceptions in their retention plans. It is recommended that further research examine the relationship between racial/ethnic group and job assignments, or selection, along with the corresponding impact on perceptions and the effect of visible versus non-visible minority status on views of equal opportunity in the military.

I. INTRODUCTION AND BACKGROUND

A. INTRODUCTION

Clearly, the U.S. Navy is very involved in maintaining a qualified corps of personnel. First and foremost, this means that adequate numbers of personnel are available to accommodate the Navy's mission requirements. Further, the key element in building a strong force depends on the ability to understand why personnel choose to leave or remain in the organization.

The "*Equal Opportunity Survey* is an element of the ... continued commitment to equality of treatment and opportunity for all service members."¹ The military is quite aware of the expression "perception is reality" and how perceptions can influence the retention of minority personnel. What the military may not know is how particular perceptions, such as one's view of opportunities, can affect personnel retention.

Figure 1, which originally addressed union membership, was adapted for consideration of Navy personnel. Figure 1 shows two dimensions of commitment: ideology, which reflects "the individuals' acceptance and support of the ideals or principles upon which labor [intensive organizations] are based"; and instrumentality, which is "the perceived value, or usefulness, associated with membership."²

As Muchinsky writes: "Commitment occurs in a context of organizational rights that are provided by the [organization] as well as organizational citizenship behaviors on the part of members. The degree of commitment can be understood in terms of the psychological [and/or physical] contract between the employee and the organization, and the role the [organization] plays in maintaining this relationship."³ Members in the high/high quadrant have a high degree of ideological and instrumental commitment and are the most active members. Instrumental members will stay and are motivated to work toward improving organizational conditions. The ideological member is low in instrumentality but high in ideological commitment; so, he or she may attend meetings

3 Muchinsky, 478.

and serve on committees out of loyalty to the organization. Lastly, members in the low/low quadrant are not committed, tend to be non-participative and may leave at the earliest opportunity. Obviously, members who are most likely to leave are in this last group. Further, how the organization addresses the concerns of these members directly affects their decision to leave or remain in the organization.

		Ideological Commitment to the Navy	
		High	Low
Instrumental Commitment to the Navy	High	Devoted Member	Instrumental Member
	Low	Ideological Member	Alienated Member

Figure 1. Typology of Commitment (After: Muchinsky, 478)

It has been said that employees join organizations but leave bosses. This suggests that managers can focus on some of the satisfaction factors (such as quality of life issues) that affect the decision to stay or go. This is where understanding human capital theory plays a valuable role. In human capital theory, an organization’s “intellectual capital is the sum of [its] human capital, structural capital, and relationship capital.”⁴ Although structure can exist after human capital changes, it is human capital that translates into relationship capital and makes the structure work to the advantage of the organization. Consequently, it is important that an organization understand what drives its human capital. The organization will be more successful if it understands the ethos of its personnel pool. Understanding quality of life or equal opportunity, for example, and how perceptions regarding it affect personnel decisions and behavior, can aid in that endeavor.

The goal of this research is to investigate the perceptions of minority personnel in the U.S. Navy regarding military/civilian opportunities and to determine the effects of these perceptions on retention. In doing so, the study uses data gathered through the

⁴ McShane-Von Glinow, *Organizational Behavior, Second Edition*, (McGraw-Hill Primus, 2003), 18.

1996 Armed Forces Equal Opportunity Survey (AFEOS) to develop a regression model that assesses the relationship between perceptions of opportunities and the decision to leave or stay in the Navy.

B. BACKGROUND

In organizational behavioral theory, decision makers are believed to have limited information-processing abilities; they are said to evaluate alternatives sequentially, evaluate alternatives against an implicit favorite alternative, process perceptually distorted information, and satisfice.⁵ To some extent, the service member affected by equal opportunity (EO) perceptions goes through this same process when determining whether to leave or stay in the Navy. The member balances time served versus time to retirement, perception of military EO versus civilian EO, job security in terms of the known versus the unknown, and family needs versus their own needs. As a result of the latter, the service member may satisfice as he or she evaluates the impact of perceptions on the desire to stay. If members compromise their own needs, they will not necessarily be happy workers and their productivity could decline.

Muchinsky defines job satisfaction as “the degree of pleasure an employee derives from his or her job.”⁶ Many unobserved factors may affect this satisfaction. Differences in personal satisfaction with a job “lie in individual differences in expectations and, in particular, the degree to which a job meets one’s expectations.”⁷ If, for example, employees have the expectation of EO, their satisfaction may decrease when they perceive inequity.

If it is true that “E4/E6 personnel are twice as productive as E1/E3 personnel,”⁸ then the Navy should obviously strive to retain its more experienced personnel. But, as suggested by Griffis et al., it might be best for this to occur naturally. In other words, an organization can look at non-monetary policies or practices that affect retention (such as

⁵ McShane, 167.

⁶ Muchinsky, 307.

⁷ Muchinsky, 307.

⁸ Warner, John T. and Beth J. Asch, “The Economics of Military Manpower,” in *Handbook of Defense Economics*, Vol. 1, (Elsevier Science, 1995), 369.

the EO policy). Further, it is suggested that poor EO conditions can cause turbulence in the work place and adversely affect productivity and retention.

C. LITERATURE REVIEW

The focus of much study over the years, both within the military and in the civilian sector, has been on employee losses. In the civilian sector, this research is commonly referred to as turnover studies; however, the military generally refers to this line of inquiry as either attrition (leaving) or retention (staying) studies. Regardless of what it is called, the objective is the same: to discover what causes an organization to lose its people and how the organization can correct the problem.

1. Civilian Studies

Brown and Yoshioka⁹ used an anonymous survey of one organization to study employee retention in a non-profit organization as related to mission attachment and satisfaction. The authors conducted both content and regression analyses, and used the following variables: mission attachment, satisfaction overall, satisfaction with pay, and intention to stay. Separate models were constructed for full-time and part-time employees. The authors found that satisfaction and mission attachment were positively correlated with the intent to stay; and, part-time employees were less likely to stay with the organization than were full-time employees. Those who intended to leave cited pay, opportunities, dissatisfaction with management, or other career plans as reasons for leaving.

Chrobot-Mason and Thomas¹⁰ used racial identity theory as a basis for understanding the interaction of minorities in predominately white organizations. The authors discuss four different relationships and how knowledge of them will aid organizations in diversity management and minority retention.

⁹ Brown, William A. and Carlton F. Yoshioka, "Mission Attachment and Satisfaction as Factors in Employee Retention," *Nonprofit Management & Leadership*, 14, No. 1 (2003): 5-18.

¹⁰ Chrobot-Mason, Donna and Kecia M. Thomas, "Minority Employees in Majority Organizations: The Intersection of Individual and Organizational Racial Identity in the Workplace," *Human Resource Development Review*, 1, No. 3 (2002): 323-344.

The Cotton and Tuttle¹¹ study was a meta-analysis of 120 turnover studies. It examined which variables were used and how they correlated to turnover. Variables that were used by no less than fifteen of the studies included pay, overall job satisfaction, satisfaction with promotional opportunities, age, tenure, gender, education, marital status, and met expectations. These variables were determined to be “stable, reliable correlates with turnover.”¹² Cotton and Tuttle also learned that many of the variables’ correlations to turnover differed depending on the group being studied (such as managerial or non-managerial, blue or white collar).

Peterson¹³ developed the Organizational Model of Employee Persistence to clarify the relationship between employee turnover and organizational practices. Key variables in the research included goals, commitment, satisfaction, and intention. The study is longitudinal and also takes into account pre-entry attributes, institutional experiences, and the departure decision. Emphasis is placed on the role of the organization—its reciprocal and symbiotic relationship to the individual—and how organizational practices affect employee perceptions. She did not test this model, but developed it for other researchers to use in analyzing employee turnover.

2. Military Studies

Although several previous studies use the 1996 AFEOS data, none take the approach employed in the present research.

Marsh¹⁴, who used data from the 1985 DoD Survey of Officers and Enlisted Personnel, developed a model for predicting U. S. Navy retention. Marsh discovered that the intent to remain in service was significantly influenced by military satisfaction.

Moore¹⁵ used data from the Military Equal Opportunity Climate Survey to evaluate the perception of Army equal opportunity climate among women and minority

¹¹ Cotton, John L. and Jeffrey M. Tuttle, “Employee Turnover: A Meta-Analysis and Review with Implications for Research,” *Academy of Management Review*, 11, No. 1 (1986): 55-70.

personnel in the U.S. Army. Her analyses had two dependent variables: perception of equal opportunity at the unit level and perception of equal opportunity in the service. The study examined gender, race, and race-gender interactions, focusing on their effects on the perceptions of women. Senior enlisted women and female officers were found to be less satisfied with the equal opportunity climate than were their male counterparts. Junior enlisted women were more positive than junior enlisted men. Enlisted black men and women were less positive than Hispanics, who were, in turn, less positive than whites. Moore also discovered race, rank, and gender effects on perceptions. While black and Hispanic male officers were less positive about the EO climate than white male officers, the perceptions of junior black officers were less positive than those of junior Hispanic officers, and the positions were reversed in the higher ranks. Overall, the effect of race was more powerful than the effect of gender.

Stewart¹⁶ used data from the 1996 AFEOS in his 2000 study to examine “the extent to which perceptions of the quality of race relations, racial incidents and the handling of such incidents influence reported levels of satisfaction with military service.” Stewart’s major findings were that women were less satisfied than men; Hispanics and Native Americans were more satisfied than whites; Asian and blacks were less satisfied than whites; and, that those of higher rank were more satisfied than lower ranks.

Weiss et al.¹⁷ attempted to provide a framework for retention and turnover studies. Before offering an integrated conceptual framework for future research, the authors reviewed old and new approaches in this area of research in terms of their strengths and weaknesses. Key to their framework is commitment (influenced by job satisfaction, job alternatives, job investments, and normative commitment behaviors), random environmental shocks (pregnancy, failure to promote, or unexpected transfer), and normal turnover times (end of contract or retirement). The authors conclude that intervention could be targeted at the individual level since this is where policy issues occur.

¹⁶ Stewart, James B., *The Effects of Racial Incidents on Satisfaction with Military Life: Evidence from Armed Forces Equal Opportunity Survey, (RSP 00-3)*, Patrick Air Force Base, FL: Defense Equal Opportunity Management Institute, 2000).

¹⁷ Weiss, Howard M., Shelley M. MacDermid, Rachele Strauss, Katherine E. Kurek, Benjamin Le, and David Robbins, “Retention in the Armed Forces: Past Approaches and New Research Directions,” (*Military Family Research Institute* at Purdue University, 2003).

In 2001, Stewart looked at “The Effects of Discrimination on Job Satisfaction in the Military: Comparing Evidence from the Armed Forces Equal Opportunity Survey and the Military Equal Opportunity Climate Survey.”¹⁸ Additionally, in 2002, McIntyre et al. examined “The Effects of Equal Opportunity Fairness Attitudes on Job Satisfaction, Organizational Commitment, and Perceived Work Group Efficacy.”¹⁹

Stewart’s research, sponsored by the Defense Equal Opportunity Management Institute (DEOMI), used the 1996 AFEOS to look at how equal opportunity affected job satisfaction in the military. He matched the AFEOS against data from the Military Equal Opportunity Climate Survey (MEOCS). Although the wording and coding were different in the two surveys, Stewart found three questions that could be compared between the surveys to evaluate job satisfaction.²⁰

In his analyses, as with many retention studies, Stewart separated men from women. In typical retention studies, this is done based on a belief that men and women behave differently. In Stewart’s study, however, the gender separation was due to the understanding that women are more likely to experience sexual and racial discrimination or harassment than are their male counterparts.

The MEOCS data used in Stewart were limited to the 1996-1997 timeframe so that they would align with the period (September 1996 to February 1997) during which the AFEOS was fielded.²¹ The corresponding sample sizes were 100,000 for the MEOCS and 35,000 for the AFEOS. Stewart found that the disparity between responses to the MEOCS equal opportunity climate and the AFEOS race relations climate indicated that these two factors were not looking at the same phenomenon.

²¹ Stewart, 4.

a. Stewart's Methodology

Figure 2, below, provides an overview of the methodology used by Stewart.

Source: Developed From Stewart's Discussion on Methodology.

Figure 2. Graphical Representation of Stewart's Study

Using the following model, Stewart employed multiple regression analysis on both AFEOS and MEOCS data to assess job satisfaction:

$$\text{Satisfaction} = f(\text{Race Relations/EO Climate; Discrimination Experience; Race/Ethnicity; Gender; Branch of Service; Paygrade; Education})^{22}$$

Stewart examined three measures of job satisfaction: JOBSEC, respondent's perception of the degree of job security; JOBSKILLS, opportunities to obtain skills; and, JOBSAT, overall job satisfaction. For racial/ethnic dummy variables, Stewart used ASIAN, BLACK, HISP, and NATAM as compared to WHITES. The base case for both analyses was "White Army males with a high school education or less."²³ The only difference between the two regressions, in terms of the base case, was the use of paygrades E1-E3 for MEOCS and paygrades E1-E4 for AFEOS. In terms of job satisfaction, Stewart refers to his findings in 2000 that showed women were less satisfied than men; Hispanics and Native Americans were more satisfied than Whites; Asian and Black Americans were less satisfied than Whites; and, that those of higher rank were more satisfied than those in lower ranks.²⁴

²² Stewart, 6.

²³ Stewart, 8.

²⁴ Stewart, 7. Mingled within the text of Stewart's 2001 study, he mentions findings from his 2000 DEOMI study entitled "The Effects of Racial Incidents on Satisfaction with Military Life: Evidence from the Armed Forces Equal Opportunity Survey."

b. Stewart's Results

Stewart found that EO climate added more to the explanatory power of the model in the MEOCS regression than MILDISC, discrimination by a military source. In fact, MILDISC was not even statistically significant in the analysis for women. As Stewart observes, “this could reflect that the broader construct of the EO climate is more closely linked to [the JOBSEC] measure of job satisfaction than race relations or it may reflect the diffuse content of the MILDISC variable.”²⁵ Although most of the results were similar in the regressions for JOBSKILLS and JOBSAT, the MILDISC variable was significant, and negative, in the MEOCS female analysis.

The effect on satisfaction measures caused by DoD discrimination experiences was negative, but small, in both the male and female analyses. Although the FEMALE coefficient in the JOBSEC and JOBSKILLS regressions was positive, it took on a negative sign in the JOBSAT regression.

On the whole, Stewart found that a healthy EO climate was “associated with higher levels of satisfaction with job security, opportunity to acquire skills, and the job overall.”²⁶

c. McIntyre et al. Study

McIntyre et al. “examined a causal model relating military respondents’ attitudes toward equal opportunity (EO)-related fairness to job satisfaction (JS), organizational commitment (OC), and perceptions of work group efficacy (WGE).”²⁷ Like Stewart, the researchers used information from the MEOCS data base for their study (drawing two 5,000 observation samples out of a possible 1,200,000 observations).

This research showed that job satisfaction and organizational commitment have a strong causal relationship: commitment was affected by the perception of fairness at both the work center and organizational levels. The results from this 2002 study support the hypothesis that “perceptions of and attitudes toward the larger organization on issues related to EO tend to influence perceptions of within work group equal opportunity fairness (EOF).” From this result, the authors conclude “that if military personnel

²⁵ Stewart, 8. See Appendix A for the Tables pertaining to Stewart’s results.

²⁶ Stewart, 12.

²⁷ McIntyre et al., 299.

believe, perceive, or feel the organization's promotional policies to be biased against the demographic group from which they come, then this belief, perception, and feeling will influence their attitudes toward [work group equal opportunity fairness]"²⁸ as well as their stated intent to remain on active duty.

The literature reviewed above helped in formulating the theoretical model as well as the regression models utilized in this research. In particular, previous studies supported the use of separate regression models based on pay grade and gender.

²⁸ McIntyre et al., 311.

II. DATA, SAMPLES, AND PRELIMINARY DATA ANALYSIS

The 1996 AFEOS Public Release files were used in the present study of minority perceptions and retention behavior. The purpose of the 1996 AFEOS was to gain “a better understanding of service members’ perceptions and experiences related to fair treatment and equal opportunity”²⁹ with the intent of providing information that the military services and the Department of Defense could use in shaping their equal opportunity efforts.

The Defense Manpower Data Center (DMDC) administered the 16-page survey over a five-month period (September 1996 through February 1997). Personnel from all of the armed services were randomly sampled. The survey was mailed to 76,754 service members in pay grades E1 through O6 and resulted in 39,855 useable responses (a response rate of 53 percent). This rather comprehensive EO survey covered areas of race relations, interpersonal relationships, perceptions of civil-military conditions and opportunities, members’ personal experiences, reporting experiences (if member reported incidents of harassment, discrimination or hate), and the military personnel lifecycle (evaluations). Of note, Scarville et al. point out that, due to the small size of the Native American portion of the services’ minority personnel, their survey results “[were] subject to the largest potential sampling error.”³⁰

For Navy personnel, the focus of this study, the numbers summed up to 16,116 observations (11,075 enlisted men, 2059 enlisted women, 2515 male officers and 467 female officers). From the AFEOS report, Navy participation was reported as 8,623 personnel (2,362 white members; 1,407 black members; 2,101 Hispanic members; 2,309 Asian/Pacific Islanders; 431 Native Americans; and 13 unknown).

Some preliminary frequencies were tabulated from the data. The descriptive statistics generated by earlier models tended to reinforce the idea that men and women have certain differences in perceptions. In fact, Figure 4 illustrates both the differences and similarities in perceptions between men and women. Table 1 defines the variables and abbreviations used in Figures 3 and 4.

Source: Based on Data From 1996 Armed Forces Equal Opportunity Survey.

Figure 4. Perceptions of Navy Personnel, and Incidents Experienced, by Gender, 1996

As seen in Figures 3 and 4, simply looking at civilian or military being “better” for each of the perception questions, ignoring the “no difference” responses (zeroed out as the variables were recoded into binary), both men and women believed conditions were “better” in the military (the lone exceptions being Quality of Life (QOL) and Pay). The primary difference between men and women is in the magnitude of their responses, which is greatly affected by the number of participants.

Overall, conditions seem better for these personnel in the military than in the civilian sector; so, we would expect them to elect to stay when the time came to choose. Of concern, however, are the two incident variables (INC_CS and INC_MS). These variables were consolidated, by the persons conducting the Armed Forces Equal Opportunity study, to incorporate any incidents that the individual might have perceived as related to, or affected by, their racial/ethnic background.³¹ The responses seem to indicate that a high percentage of incidents were caused by, or occurred around, both civilians and military personnel. Initially, this appears to be inconsistent with the responses to the other questions. In reality, however, this merely reinforces the notion that the military, as a microcosm of society, is not fully removed from conditions

³¹ Reference Appendix G, Armed Forces Equal Opportunity Survey documentation, G-459 and G-460, the incident variables were constructed by consolidating six DOD indices for INC_MS and two civilian indices for INC_CS covering any of the behaviors the member may have experienced as originating from DOD or civilian sources.

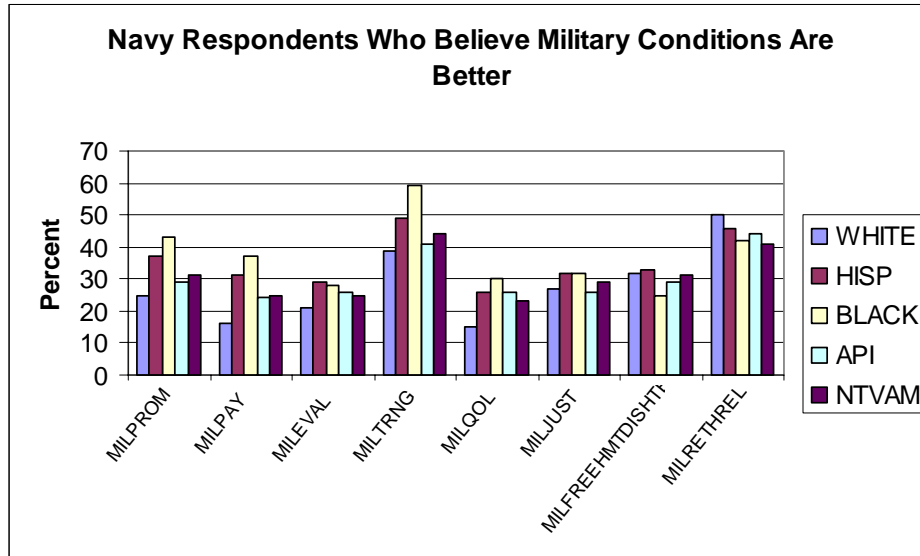

occurring in the civilian sector. Rather, in comparison, conditions within the military are seen as being “better” than those existing in society-at-large.

Table 2, below, shows the percent of Navy personnel who say that conditions in the military are better than they are in the civilian sector. As seen in Table 2, blacks are most positive regarding the military conditions (promotion; pay; evaluation; training; quality of life) in the Navy. Black Navy personnel are most closely followed by Hispanics, across the spectrum of perceptions. In the case of these evaluations, freedom from harassment, discrimination and hate, and racial/ethnic relations, a higher percentage of Hispanics believe these conditions are better in the Navy than is the case for other racial/ethnic minorities. With the exception of justice, racial/ethnic relations, and freedom from harassment, discrimination and hate, whites are the least positive toward differences that favor the military. Figure 5 presents a graphical depiction of the racial/ethnic data from Table 2.

Table 2. Percent of Navy Personnel Who Say Military Conditions Are Better than Civilian Conditions, by Race/Ethnicity and Selected Conditions, 1996, Based on Data From 1996 Armed Forces Equal Opportunity Survey.³²

Figure 5. Perceptions of Military Conditions by Race/Ethnicity, 1996

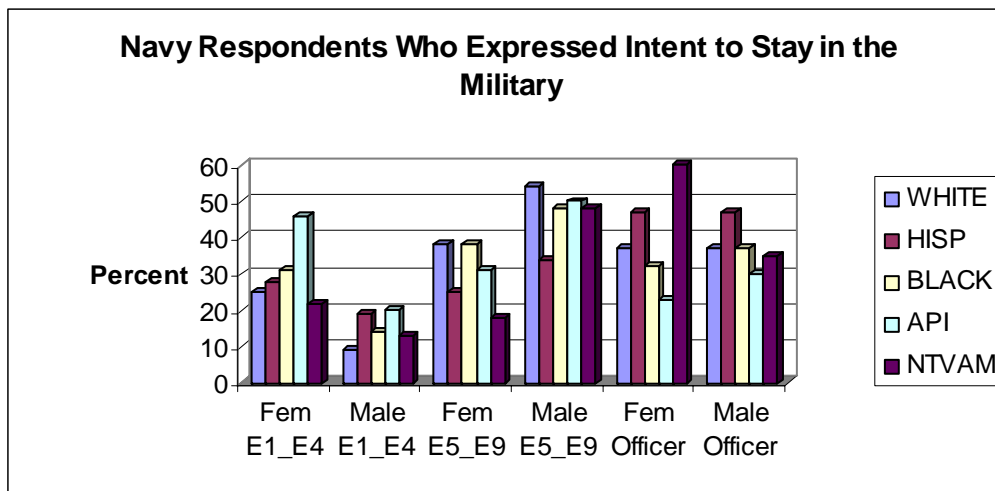

In general, as seen in Table 2 and Figure 5, with the exception of the perceptions of freedom from harassment, discrimination, hate and racial/ethnic relations, blacks (followed closely by Hispanics) tended to be more positive than other racial/ethnic groups in their perceptions of military opportunities. And, when the AFEOS asked (in question 28 of the survey) the respondents if they would stay on active duty, as Table 3 shows, the group with the highest percent expressing the intent to stay was Native-American female officers. The second highest level of intent occurred for White E5-E9 males. As expected, the lowest stated intent to remain in the Navy was found among junior enlisted personnel. Figure 6 presents the same data from Table 3 in graphical form to highlight differences between groups.

³³ As with Table 1, HISP is Hispanic; API is Asian/Pacific Islander; and, NTVAM is Native American.

Table 3. Percent of Navy Personnel Who Intend to Stay in the Military by Race/Ethnicity, Gender, and Enlisted Pay Grade or Officer Status, 1996

Gender & Pay Grade	WHITE	HISP	BLACK	API	NTVAM

Source: Based on Data From 1996 Armed Forces Equal Opportunity Survey, this figure corresponds with Table 3.³⁵

Figure 6. Intent to Stay in the Military by Pay Grade, Gender, and Race/Ethnicity

As Table 3 and Figure 6 show, senior personnel tend to express the intent to stay at relatively moderate levels. In general, junior enlisted women (across all ethnic groups) have a higher intent to stay than do their male counterparts; senior enlisted men (across all ethnic groups) have a higher intent to stay than do their female counterparts; and, intent to stay among officers is about the same among men and women who are white or Hispanic. In contrast, Asian/Pacific Islander female officers and black female officers

³⁴ Fem is female; HISP is Hispanic; API is Asian/Pacific Islander; and, NTVAM is Native American.

³⁵ As with Table 3, Fem is female; HISP is Hispanic; API is Asian/Pacific Islander; and, NTVAM is Native American

who are less likely to stay than are their male counterparts, and Native American female officers have a significantly higher intent to stay than do their male counterparts.

How do the observations pertaining to perceptions and incidents bear up in a multivariate analysis? How do personnel perceptions affect the intent to stay when other factors influencing retention are controlled?

THIS PAGE INTENTIONALLY LEFT BLANK

III. MODELS

A. THEORETICAL MODEL

Figure 7 is a simple conceptual model that depicts the relationship between perceptions of opportunities and one's hypothesized decision to leave or remain in the organization.

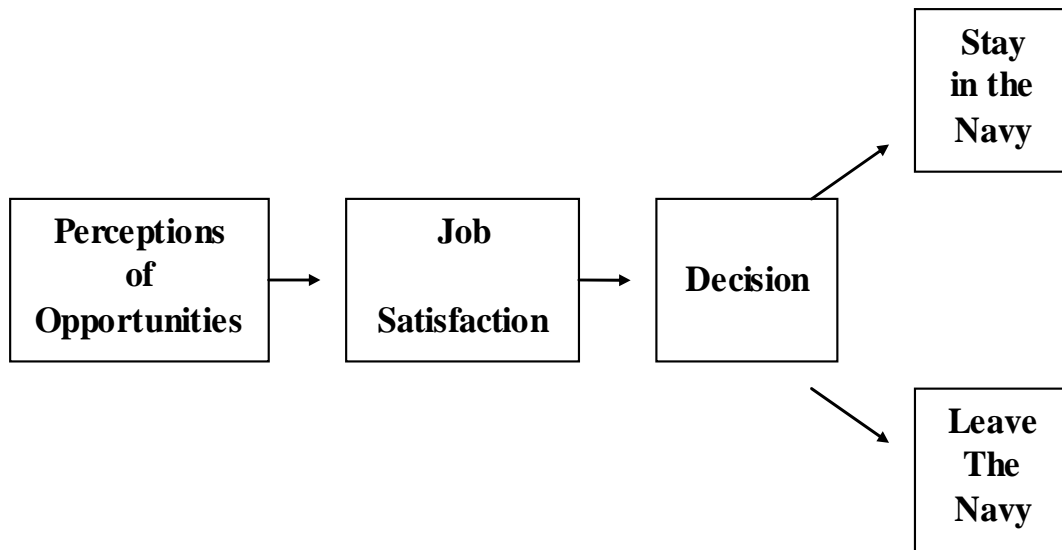

Figure 7. The Effect of Perceptions

In general, if a military member believes that opportunities are better in the civilian sector than they are in the military, then, when the time comes to decide whether to stay or go, they will go. Given the association mentioned in Stewart's overall results, it could be said that positive perceptions of EO lead to job satisfaction, which positively affect the intent to stay on active duty. This premise forms the basis for the analysis performed for this paper. The primary focus, of course, is on the perceptions of minority personnel who are the ones expected to be most affected by behaviors of harassment, discrimination, hate, race-ethnic relations, or any other incidents that may be related to racial/ethnic bias (such as poor evaluations, less training opportunities, worse quality of life, and unequal assignment and promotion opportunities). A logistic regression model was developed to test this theory.

B. MULTIVARIATE STATISTICAL MODEL

In specifying the model, logistic regression was selected for analyzing the data since it is the appropriate approach for regressions with a binary dependent variable. It is better for problems of heteroskedasticity and it eliminates the unboundedness problem found in the linear probability model.³⁶

1. Logistic Regression

In this study, the value of the dependent variable is interpreted as the probability of a Sailor intending to stay in the U.S. Navy.

$$P(\text{Intent to stay}) = \frac{1}{1 + e^{-(B_0 X_0 + B_1 X_1 + \dots + B_k X_k)}}$$

P is the probability that a Sailor intends to stay on active duty and e is the base of the natural logarithm. The X_s are the values of the explanatory variables, the B_s are the values for the estimated parameters of the model, and K denotes the number of explanatory variables measured for each individual.

2. Specifying the Model

The dependent variable chosen for the model, “Intent,” was defined as a binary variable, where intent to stay was set equal to 1 and undecided, and unlikely to reenlist, responses were set equal to 0. The independent variables in the model included demographic characteristics and perception factors.

The resulting regression model is as follows:

Intent = *f* (Race/Ethnicity (RETH); Pay grade; Gender; Marital Status; Perceptions of equal opportunities; and, Interactions between perceptions and race/ethnicity).

The branch of service selected for this study was Navy. The survey’s RETH variable was broken into White (which served as the base case), Hispanic (HISP), Black, Asian/Pacific Islander (API), and Native American (NTVAM). Gender was broken into male and female. Pay grade was broken into three groups (junior enlisted (E1-E4), senior enlisted (E5-E9), and officer). Pay grade and gender were controlled for via separate

³⁶ This claim is in keeping with econometrics theory as taught in MN 4111 and supported by Woolridge, Jefferey M., *Introductory Econometrics: A Modern Approach*, (Mason, OH: Thomson, 2003).

models. Marital Status is represented by the term MARRIED in the model (with Single as the base case). Perceptions of opportunities are based on question 73 of the AFEOS which compared perceptions of civilian and military opportunities in the areas of promotion, pay, evaluations, training, justice, race/ethnic relations, quality of life, freedom from harassment; freedom from discrimination; and, freedom from hate. Specifically, the question asked “Would you say that opportunities/conditions for people of your race/ethnic group are better in the military, better in civilian employment or that there isn’t any difference?”³⁷ In answering the question, respondents had the choices of (1) better as a civilian, (2) no difference or (3) better in the military which were recoded for our military focus variables as (1) yes being choice 3 and (0) no being choices 1 and 2. Given high collinearity among them, the jointly significant variables MILFREEHRSM, MILFREEDISCR, and MILFREEHATE were combined to form the variable MILFREEHMTDISHT. Before moving into the specification of the combined, or interaction, terms, a brief word or two about their design and intent may be helpful. In general, interaction variables are designed to show how the effect of one variable impacts the effect of another variable when the two are combined. In order to see how being a member of a race/ethnic group affects the influence of a perception on the intent to stay in the Navy, the ethnic terms were interacted with the perception terms.

Since it was determined that the incident variables (INC_CS and INC_MS) recorded actual events rather than perceptions, these variables were not included in the final models.

3. Hypothesized Relationships

In contemplating the hypothesized relationships, serious consideration was given not only to the expectations from standard retention models but also personal views of minority perceptions in today’s Navy. Basically, the military is a microcosm of society; thus, any conditions that exist in American society can be expected to exist to some extent in the military. Thus, the comparative analysis in this thesis does not expect to determine levels of EO in the military or in the civilian sector; rather, it seeks to determine if personnel *perceive* the climate to be better in the military than it is in the

³⁷ Scarville et al., 180.

civilian sector. This perception is hypothesized as becoming the extra weight on the scale that tips the individual's decision toward staying in the military or leaving for a civilian job.

If members believe that the climate is better in the military, then they are more likely to stay. That being the case, it is expected that the coefficients for military variables (indicating that conditions are perceived to be better in the military) will be positive, since this will encourage people to stay. It is also expected that, given seniority and promotion success, senior enlisted personnel will have more positive perceptions of opportunities and are more likely to stay; and, conversely, for junior personnel, who don't have as much success or job experience, the coefficient is expected to be negative. With the belief that married personnel tend to be more stable and, therefore, less likely to leave, it is expected that the coefficient for married personnel will be positive. Given that Hispanic and Native American personnel reported higher levels of satisfaction than did whites in Stewart's DEOMI study, it is expected that they will be more likely to stay in and, therefore, have a positive coefficient. Although Stewart found that blacks and Asian Americans were less satisfied than whites, it is not expected that the signs related to their coefficients will be negative across all of the models.

Hypotheses:

$H_o : \beta_1 = \beta_2 = \dots \beta_{45} = 0$ None of the coefficients are statistically different from zero such that there is no difference between perceptions of military opportunities and civilian opportunities.

$H_A : \text{At least one } \beta_i \neq 0$ At least one of the coefficients is statistically different from zero such that there is a difference in perceptions.

As previously mentioned, in the logistic regression models, separate models were specified for rank and gender due to the belief, supported by previous studies, that behaviors are different across pay grades and genders.

IV. RESULTS OF MULTIVARIATE MODELS

Although numerous logistic regression analyses were performed on the data, only the nine best models were chosen for evaluation.

A. GOODNESS OF FIT

Table 4 shows information for both model fit and parameter estimates for the models estimated for all pay grade groups except senior enlisted women. An alternate model specification used for this group and for a second female officer model is discussed later in this chapter. Of the seven models depicted in these tables, those for enlisted men had the lowest R^2 values (.0988 for the E1-E4 model and .0472 for the E5-E9 model); whereas, the combined, or all, model for enlisted men netted the highest R^2 value (.3460). The model for female officers was the only one that proved not significant overall based on the Likelihood ratio test of the global null hypothesis (with a likelihood probability of .2958). Each of the enlisted models as well as the male officer model can be considered to have a good fit.

As another indicator of goodness of fit, classification tables were constructed for each model. The all-male enlisted and all-female enlisted models had the highest correct prediction percentages (86 percent and 85 percent, respectively). The next highest correct prediction percentage resulted in a three-way tie wherein the male E1-E4, the female E1-E4, and the male officer models all had 61 percent correctly classified. The E5-E9 male model could only correctly predict 53 percent of the time. The female officer model had the lowest proportion at 49 percent correctly classified.

Table 5 depicts the results of models for senior enlisted women and female officer models wherein the race/ethnic groups API and NTVAM were combined into one group (OTHER). This re-designation was done to correct for the senior enlisted female model's failure to converge, reflecting the small number of observations in these two racial/ethnic groups. The quasi-complete separation encountered in the estimation process was the result of too few observations for the given number of variables. Since this adaptation resulted in a valid model (with a likelihood probability of .0624) for senior enlisted females, the same design was utilized for female officers. Although the Log-likelihood

probability (.1815) improved, it was not enough to reject the global null hypothesis. The R^2 value for the senior enlisted female model (.1554) was fairly close to that attained in the model for junior enlisted women (.1655). For both E5-E9 female enlisted personnel and female officers, the model can correctly predict 50 percent of the time. While this percentage is lower than those of the other models for enlisted women, it is a slight improvement over the female officer model that has the API and NTVAM racial/ethnic groups represented separately. With more observations in the combined racial/ethnic group Other, better predictions would be expected for the interaction terms.

B. PARAMETER ESTIMATES FOR FIRST SEVEN MODELS

In evaluating the significance of the parameter estimations, one-tailed tests of directional hypotheses were considered in keeping with the directional hypothesis developed in Chapter III. Of note, the models for men tended to have more significant variables than the models for women (24 for the combined male enlisted model and 21 for the male officer model, while the combined female enlisted model had 20 and the female officer model had 13).

1. Demographic and Military Background Control Variables

The MARRIED variable took on the expected positive sign in all five of the models for which it was significant (all at the .01 level of significance). This suggests that being married serves as an inducement for staying on active duty. For some, marriage creates more stability; for others, active duty is seen as better in providing economically for the family unit.

The E1-E4 junior enlisted variable had a positive sign and was significant (at the .01 level of significance) in both the all-male enlisted and all-female enlisted models. This suggests that junior enlisted personnel in the sample are less likely to leave the service. This is contrary to the expectation that young people in society tend to change jobs frequently and/or cannot accept authority and discipline as well as older individuals, and that they consequently have a higher tendency to leave the service.

2. Racial/Ethnic Group Variables

In Table 4, it is evident that none of the racial/ethnic group variables were significant across all of the models. The Hispanic variable was not positive and significant in any model. It took on a negative sign in all but the female officer model. The black variable also was never positive and significant. It took on negative signs in two of the models. The Asian/Pacific Islander variable was never positive and significant. It also took on negative signs in the two models. The variable for Native Americans, however, was positive and significant in three of the enlisted models, and it was negative in the male officer model.

3. Perception Variables

Looking at the perception variables, it can be seen that MILPAY was positive and significant (at the .1 level of significance) in the model for junior enlisted male personnel. It took on a negative sign in the male officer model. MILEVAL was positive and significant (at a .01 level of significance) in the male officer model. It took on a negative sign in the combined female enlisted model. MILTRNG was positive and significant in three models (at the .01 level of significance in the all-male enlisted and male senior enlisted models and at the .05 level of significance in the all-female enlisted model). MILQOL was positive and significant in five of the seven models (at the .05 level of significance in the male junior enlisted model, and at the .1 level of significance in the male senior enlisted, female junior enlisted, and male officer models). It took on a negative sign in the female officer model. MILJUST was positive and significant in two models (at the .1 level of significance in the junior enlisted female model and at the .01 level of significance in the all enlisted female model). MILFREEHMTDISHTE was positive and significant in three models (all-male enlisted, male senior enlisted, and female officer models—all at the .05 level of significance). It took on a negative sign in the female junior enlisted model. Lastly, MILRETHREL was positive and significant in two models (the all-male enlisted model at the .01 level of significance and the all-female enlisted model at the .05 level of significance).

*** Indicates significance at the .01 level; **indicates significance at the .05 level; and, *indicates significance at the .1 level of significance.

So, what does all of this indicate about perceptions? From the all-male enlisted model, it can be seen that the intent to stay on active duty was positively influenced by the perceptions of enlisted male personnel regarding training, freedom from harassment, discrimination, and hate, and racial/ethnic relations. Junior enlisted men were positively influenced by their perceptions of pay and quality of life. Senior enlisted men were positively influenced by their perceptions of training, quality of life, and freedom from harassment, discrimination, and hate. In the all-female enlisted model, enlisted women were positively influenced by their perceptions of training, justice and racial/ethnic relations. Junior enlisted women were positively influenced by their perceptions of quality of life and justice. In the officer models, male officers were positively influenced by their perceptions of evaluations and quality of life. Female officers, on the other hand, were positively influenced by their perception of freedom from harassment, discrimination, and hate.

4. Interactions Between Racial/Ethnic Group and Perception Variables

The primary objective of the analysis was to investigate the effects of perceptions of equal opportunity on the planned retention of members of racial/ethnic minority groups. As previously observed in Chapter III, the intent of the interaction variables is to test whether being a member of a racial/ethnic group affects the influence of a perception on the intent to stay in the Navy.

Of the ethnic-perception interactions, HISP_MILPROM was not significant in any of the seven models shown in Table 4. HISP_MILPAY was positive and significant (at the .01 level of significance) in the male officer model. HISP_MILEVAL took on a negative sign in the male officer model. HISP_MILTRNG was positive and significant at the .05 level of significance in the all-male enlisted, male junior enlisted, and all-female enlisted models. It was also positive in the female officer model, but, only at the .1 level of significance. HISP_MILQOL was positive and significant (at the .05 level of significance) in the female officer model. HISP_MILJUST was positive and significant (at the .05 level of significance) in the male officer model. It took on a negative sign in the all-female enlisted model. HISP_MILFREEHMTDISHTE was not significant in any of the seven models. The last of the Hispanic interaction variables, HISP_MILRETHREL, was not positive and significant in any of the models. It took on a negative sign in the all-male enlisted model.

Thus the results indicate that Hispanic men in the all-male enlisted model were positively influenced by their perception of training. Hispanic women in the all-female enlisted model were also positively influenced by their perception of training. Hispanic Junior enlisted men were positively influenced by their perception of training. No conclusions can be drawn regarding junior enlisted women or senior enlisted Hispanic men. Hispanic male officers were positively influenced by their perception of pay and justice while Hispanic female officers were positively influenced by their perception of training and quality of life.

A review of the black interaction variables shows that BLACK_MILPROM was positive and significant (at the .05 level of significance) in the female junior enlisted model. BLACK_MILPAY was positive and significant in both the all-male enlisted and male officer models (at the .05 and .01 levels of significance, respectively).

BLACK_MILEVAL was positive and significant in two models (male junior enlisted model, at the .1 level of significance, and the all-female enlisted model, at the .05 level of significance). BLACK_MILTRNG was positive and significant in two models (at the .01 level of significance in the all-male enlisted model and at the .1 level of significance in the male junior enlisted model). BLACK_MILQOL was positive and significant in two models (the all-female enlisted and female officer models). BLACK_MILJUST was positive and significant in three models (all-male enlisted, male senior enlisted, and male officer models—at the .05 level of significance for both male enlisted models and the .1 level of significance for male officers). BLACK_MILFREEHMTDISHTE was not positive and significant in any of the models, nor was BLACK_MILRETHREL.

These results indicate that black men in the all-male enlisted model were positively influenced by their perceptions of pay, training, and justice. Black women in the all-female enlisted model were positively influenced by their perceptions of evaluations and quality of life. Black junior enlisted men were positively influenced by their perceptions of evaluations and training. Black junior enlisted women were positively influenced by their perceptions of promotion opportunities. Black senior enlisted men were positively influenced by their perceptions of justice. Black male officers were positively influenced by their perceptions of pay and justice, while black female officers were positively influenced by their perceptions of quality of life.

For the Asian/Pacific Islander interaction terms, API_MILPROM was positive and significant (at the .05 level of significance) in the male senior enlisted model. API_MILPAY was positive and significant (at the .1 level of significance) in the male officer model. API_MILEVAL was positive and significant (at the .1 level of significance) in both the male junior enlisted and all-female enlisted models. API_MILTRNG was positive and significant (at the .1 level of significance) in the male junior enlisted model. API_MILQOL was positive and significant in two models (all-female enlisted and male officer models—both at the .1 level of significance) while API_MILJUST was not positive and significant in any of the models. API_MILFREEHMTDISHTE was positive and significant (at the .01 level of significance) in the female junior enlisted model. The last of the Asian/Pacific Islander

interaction variables, API_MILRETHREL, was not significantly positive in any of the models.

These results indicate that Asian/Pacific Islander men in the all-male enlisted model were not positively influenced by any of their perceptions. API women in the all-female enlisted model were positively influenced by their perceptions of evaluations and quality of life. Junior enlisted API men were positively influenced by their perceptions of evaluations and training. Junior enlisted API women were positively influenced by their perceptions of freedom from harassment, discrimination, and hate. Senior enlisted API men were positively influenced by their perceptions of promotion opportunities. API male officers were positively influenced by their perceptions of pay and quality of life. No inferences could be drawn regarding API female officers.

The Native American interaction variable NTVAM_MILPROM was positive and significant (at a .05 level of significance) in the female junior enlisted model. NTVAM_MILPAY was positive and significant (at the .01 level of significance) in the male officer model. NTVAM_MILEVAL was not positive and significant in any of these seven models. NTVAM_MILTRNG was positive and significant, at the .05 level of significance, in three models (male junior enlisted, all-female enlisted, and male officer models). NTVAM_MILQOL was positive and significant (at the .01 level of significance) in the all-male enlisted model and (at the .05 level of significance) in the female officer model. NTVAM_MILJUST was positive and significant, at the .1 level of significance, in the male officer model. NTVAM_MILFREEHMTDISHTE was not positive and significant in any of the seven models. The last of the Native American interaction variables, NTVAM_MILRETHREL, was positive and significant in both the female junior enlisted and female officer models (at the .05 and .1 levels of significance, respectively).

These results indicate that Native American (NTVAM) men in the all-male enlisted model were positively influenced by their perceptions of quality of life. NTVAM women in the all-female enlisted model were positively influenced by their perceptions of training. Junior enlisted NTVAM men were also positively influenced by their perceptions of training. Junior enlisted NTVAM women were positively influenced

by their perceptions of promotion opportunities and racial/ethnic relations. No inferences could be drawn regarding the perceptions of senior enlisted NTVAM men. NTVAM male officers were positively influenced by their perceptions of pay, training and justice; in contrast, NTVAM female officers were positively influenced by their perceptions of quality of life and racial/ethnic relations.

C. PARAMETER ESTIMATES FOR ALTERNATE MODELS

As stated previously, Table 5 depicts the results of models for female senior enlisted personnel and female officers where the racial/ethnic groups API and NTVAM were combined into one group (OTHER). It can be seen in Table 5 that only four variables were positive and significant in the female senior enlisted model and five variables were positive and significant for female officers in this model specification.

1. Demographic Control Variable

The MARRIED variable was not significant in either of the two senior female models. Therefore, no inferences can be drawn regarding the effect of this variable on senior women.

2. Racial/ethnic Group Variable

None of the racial/ethnic dummy variables were positive and significant. The OTHER variable took on a negative sign in the female senior enlisted model.

3. Perception Variables

Of the perception variables that were significant, MILQOL was positive (at a .1 level of significance) in the female senior enlisted model. The only other perception variable to be significant in these last two models is MILFREEHMTDISHTE, which was positive (at a .05 level of significance) in both of these senior female models. These results indicate that female senior enlisted personnel were positively influenced by their perceptions of quality of life, and that both senior enlisted women and female officers were positively influenced by their perceptions of freedom from harassment, discrimination, and hate.

4. Interactions Between Racial/Ethnic Group and Perception Variables

Of the Hispanic interaction terms, HISP_MILTRNG was positive and significant (at the .1 level of significance) in the female officer model. HISP_MILQOL was positive and significant (at the .05 level of significance) in the female officer model. None of the remaining Hispanic interaction terms (HISP_MILFREEHMTDISHTE, HISP_MILRETHREL, and HISP_MILJUST) were positive and significant in either of the senior female models. The results indicate that senior enlisted Hispanic women were not positively influenced by any of their perceptions. Hispanic female officers were positively influenced by their perceptions of training and quality of life.

Looking at the black interaction variables, it can be seen that BLACK_MILEVAL was positive and significant in the female senior enlisted model (at the .05 level of significance). BLACK_MILQOL was positive and significant (at the .05 level of significance) in the female officer model. These findings indicate that senior enlisted black women were positively influenced by their perceptions of evaluations; in contrast, black female officers were positively influenced by their perceptions of quality of life.

Among the Other interaction terms that were significant, OTHER_MILTRNG was positive and significant (at the .01 level of significance) in the female senior enlisted model. OTHER_MILQOL was positive and significant (at the .05 level of significance) in the female officer model. The results indicate that Other senior enlisted women (Native American and Asian/Pacific Islanders) were positively influenced by their perceptions of training. Other female officers were positively influenced by their perceptions of quality of life.

D. TEST FOR MULTICOLLINEARITY

Due to the large number of insignificant coefficients, a test was conducted to investigate the possibility that something in the models' design could be inducing this effect. Particularly, is multicollinearity a problem? To check for this, a Variance Inflation Factor (VIF) test was performed for each of the models. Variables associated with VIF values that are higher than the model's VIF would be considered to be more closely aligned with other independent variables than with the dependent variable (meaning that the reliability of the coefficient estimates may have been decreased due to multicollinearity).³⁸ SAS programs generated VIFs for each of the independent variables in the model. To calculate the overall VIF for each of the models, the following formula was used:

$$\text{VIF}_{\text{model}} = \frac{1}{(1 - R^2)}$$

Results: $\text{VIF}_{\text{Emale}} = 1.794$ $\text{VIF}_{\text{E1_E4male}} = 1.114$ $\text{VIF}_{\text{E5_E9male}} = 1.048$

$\text{VIF}_{\text{Efemale}} = 1.573$ $\text{VIF}_{\text{E1_E4fem}} = 1.198$ $\text{VIF}_{\text{E5_E9fem}} = 1.167$ $\text{VIF}_{\text{Omale}} = 1.124$ $\text{VIF}_{\text{Ofemale}} = 1.107$

$\text{VIF}_{\text{otherOfem}} = 1.094$

In the all-male enlisted model, only three variable VIFs did not exceed the model's VIF (API, Married, and E1-E4). In the male E1-E4 model, only the Married variable's VIF did not exceed the model's VIF. The same held true for the male E5-E9 model, the female E1-E4 model, and each of the officer models. In the all-female enlisted model, two variable VIFs (Married and E1-E4) did not exceed the model VIF. In the female E5-E9 model, all of the variable VIFs exceeded the model VIF. Basically, this shows that the results of the estimates should be observed with caution.

E. PARTIAL EFFECTS

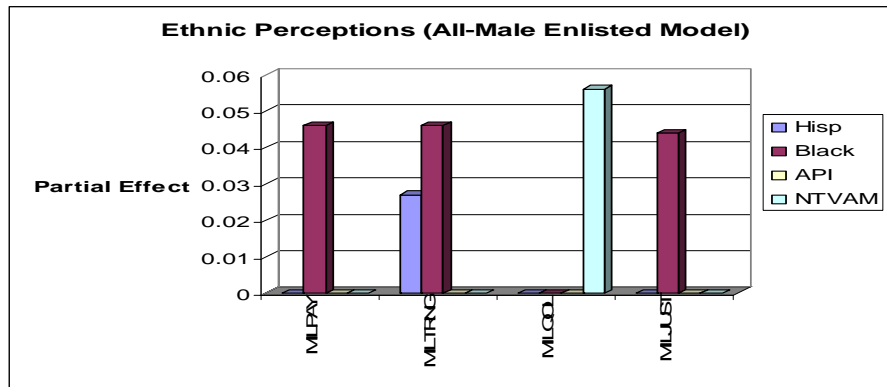

Figures 8 through 14 graphically depict the partial effects of the statistically significant variables in the first seven models (models that have all of the racial/ethnic groups represented). Figures 15 and 16 show the partial effects for the last two models (where, as previously mentioned, Asian/Pacific Islanders and Native Americans were combined into one group called Other). The basic construct of partial effects is a

³⁸ Freund, R. J. and R. C. Littell, *SAS System for Regression*, MN 4111 Handout, (Monterey, CA: Naval Postgraduate School, 2004), 98.

comparison between a notional individual or reference variable (the base case) and another individual who differs from the notional person on the variable being investigated. Consequently, the partial effects are ceteris paribus (other things being equal). A variable only appears in these partial effects figures if it is significant and positive in at least one of the models being compared. The discussion of the results is limited to the key variables of interest—the ethnic-perception interaction variables. A more detailed discussion for all of the variables is available in Appendix E.

1. Combined Enlisted Male Model

As seen in Figure 8, the all-male enlisted model reflected that, in terms of the ethnic-perception interaction variables, Hispanic men are more likely than their white counterparts to stay in service based on their perception that training opportunities are better in the military. Black men are more likely than their white counterparts to plan to stay on active duty based on their perception that pay, training, and justice are better in the military. NTVAM men are more likely than their white counterparts to stay on active duty based on their perception that quality of life is better in the military. The largest partial effect for these interaction terms in this model is the .056 increase in the probability of staying due to the perceptions of Native American enlisted men that military quality of life is better.

Figure 8. Partial Effects for Significant Positive Variables (Combined Enlisted Male Model)

³⁹ The conditions are described in Table 1. HISP is Hispanic; API is Asian/Pacific Islander; and, NTVAM is Native American.

2. Male Junior Enlisted Model

When separated into paygrade groups (see Figure 9), Hispanic men in the junior enlisted model are more likely than their white counterparts to stay in service based on their perception that training opportunities are better in the military. Black junior enlisted men are more likely than their white counterparts to stay on active duty based on their positive perceptions of military evaluations and training. API junior enlisted men, like black males in these pay grades, are also more likely than their white counterparts to stay on active duty based on their positive perceptions of military evaluations and training. NTVAM junior enlisted men are more likely than their white counterparts to stay on active duty based on their positive perception that military training opportunities are better. The largest partial effect for these interaction terms in this model is the .2 increase in the probability of staying due to the perception of Asian/Pacific Islander junior enlisted men that military evaluations are more fair.

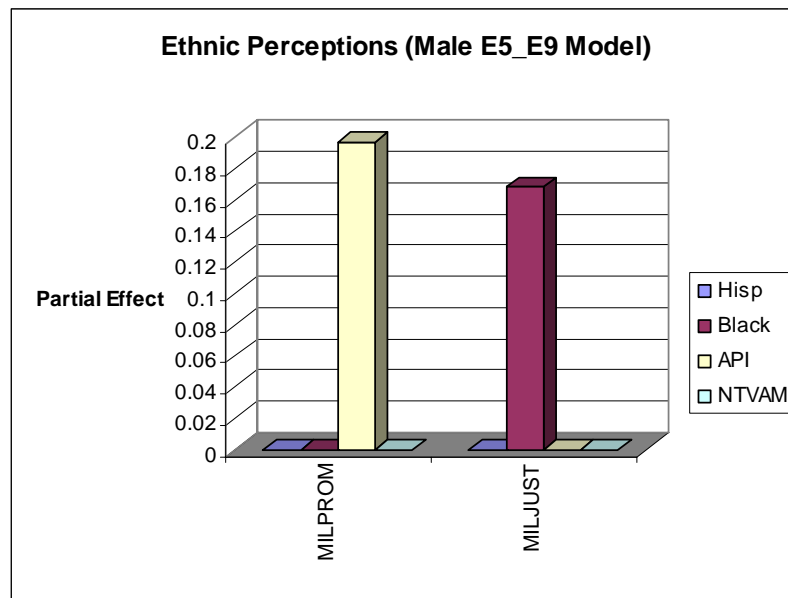

Figure 9. Partial Effects for Significant Positive Variables (E1-E4 Men)

3. Male Senior Enlisted Model

No conclusions could be drawn from the data regarding the effect of perceptions on the retention plans of senior enlisted Hispanic males. Senior enlisted black men are more likely than their white counterparts to stay on active duty based on their positive

⁴⁰ The conditions are described in Table 1. HISP is Hispanic; API is Asian/Pacific Islander; and, NTVAM is Native American.

perceptions of military justice. Senior enlisted API males are more likely than their white counterparts to stay on active duty based on their positive perceptions of military promotion opportunities. No conclusions could be drawn from the data regarding senior enlisted Native American men. The largest partial effect for these interaction terms in this model is the .2 increase in the probability of staying due to the perception of Asian/Pacific Islander male senior enlisted personnel that military promotion opportunities are better.

Source: Based on Regressions Performed on Data From the 1996 Armed Forces Equal Opportunity Survey.⁴¹

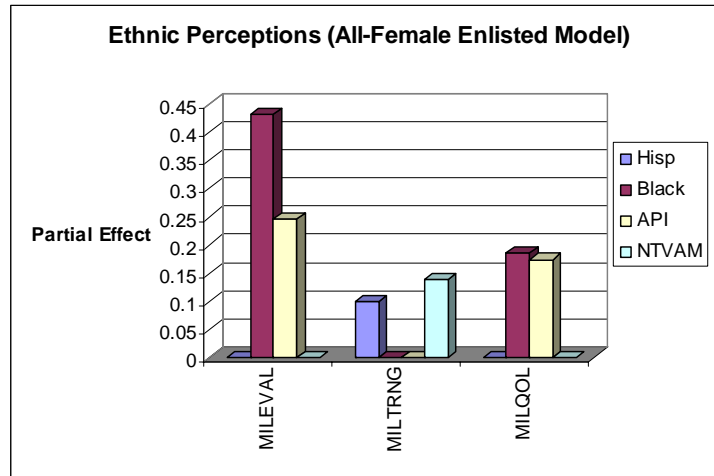

Figure 10. Partial Effects for Significant Positive Variables (E5-E9 Men)

4. Combined Female Enlisted Model

As seen in Figure 11, based on the ethnic-perception interactive variables, Hispanic women in the combined female enlisted model are more likely than their white counterparts to stay in service based on their positive perception of training. Black women are more likely than their white counterparts to stay in service based on their positive perception that evaluations and quality of life are better in the military. API women in the combined female enlisted model are more likely than their white counterparts to stay based on their positive perception of military evaluations and quality

⁴¹ The conditions are described in Table 1. HISP is Hispanic; API is Asian/Pacific Islander; and, NTVAM is Native American.

of life. NTVAM women in this model are more likely than their white counterparts to stay based on their positive perception that military training opportunities are better. The largest partial effect for the interaction terms in this model is the .43 increase in the probability of staying due to the perceptions of black enlisted women that military evaluations are better.

Source: Based on Regressions Performed on Data From the 1996 Armed Forces Equal Opportunity Survey.⁴²

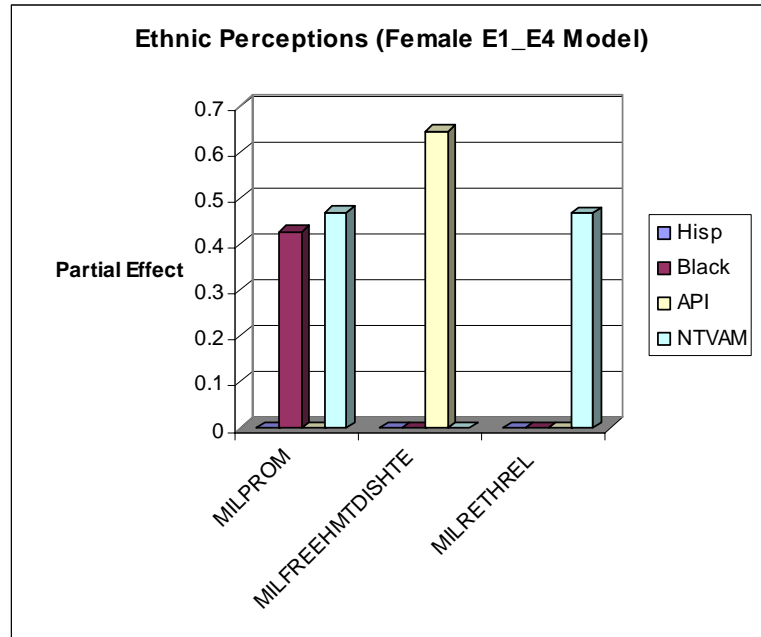

Figure 11. Partial Effects for Significant Positive Variables (Combined Enlisted Women)

5. Female Junior Enlisted Model

The results for the ethnic-perception interaction terms in the female junior enlisted model, depicted in Figure 12, show that no inferences can be drawn regarding Hispanic junior enlisted women. However, black junior enlisted women are more likely than their white counterparts to stay in service based on their positive perceptions of military promotion opportunities. API junior enlisted women are more likely than their white counterparts to stay based on their positive perception of military freedom from harassment, discrimination, and hate. NTVAM junior enlisted women are more likely than their white counterparts to stay in service based on their perception that promotion opportunities and racial/ethnic relations are better in the military. The largest partial effect for these interaction terms in the model is the .64 increase in the probability of

⁴² The conditions are described in Table 1. HISP is Hispanic; API is Asian/Pacific Islander; and, NTVAM is Native American.

staying due to the perception of Asian/Pacific Islander female junior enlisted personnel that freedom from harassment, discrimination, and hate is better in the military.

Source: Based on Regressions Performed on Data From the 1996 Armed Forces Equal Opportunity Survey.⁴³

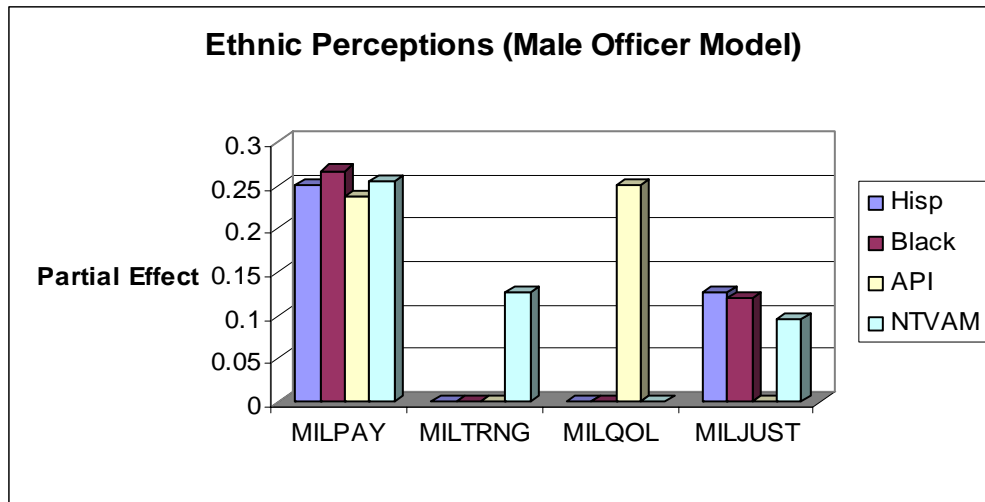

Figure 12. Partial Effects for Significant Positive Variables (E1-E4 Women)

6. Male Officer Model

As seen in Figure 13, Hispanic male officers are more likely than their white counterparts to stay in service based on their perceptions that military pay and justice are better. Black male officers are also more likely than their white counterparts to stay based on their positive perceptions of military pay and justice. API male officers are more likely than their white counterparts to stay based on their perception of military pay and quality of life and less likely than their white counterparts to stay based on their positive perception of military evaluations. NTVAM male officers are more likely than their white counterparts to stay based on their positive perception of military pay, training and justice. The largest partial effect for these interaction terms in this model is the .27

⁴³ The conditions are described in Table 1. HISP is Hispanic; API is Asian/Pacific Islander; and, NTVAM is Native American.

increase in the probability of staying due to the perception of black male officers that military pay is better.

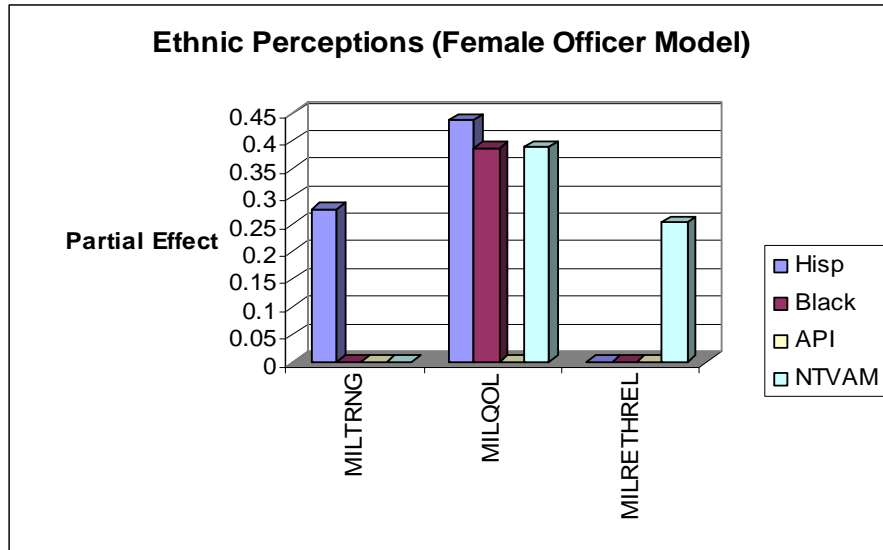

Source: Based on Regressions Performed on Data From the 1996 Armed Forces Equal Opportunity Survey.⁴⁴

Figure 13. Partial Effects for Significant Positive Variables (Male Officers)

7. Female Officer Model

Hispanic female officers are more likely than their white counterparts to stay in service based on their positive perception of military training and quality of life. Black female officers are more likely than their white counterparts to stay based on their perception that quality of life is better in the military. No inferences can be drawn from the data regarding APIs in the female officer model. NTVAM female officers are more likely than their white counterparts to stay based on their positive perceptions of military quality of life and racial/ethnic relations. As Figure 14 shows, the largest partial effect for these interaction terms in the model is the .44 increase in the probability of staying due to the perception of Hispanic female officers that quality of life is better in the military.

⁴⁴ The conditions are described in Table 1. HISP is Hispanic; API is Asian/Pacific Islander; and, NTVAM is Native American.

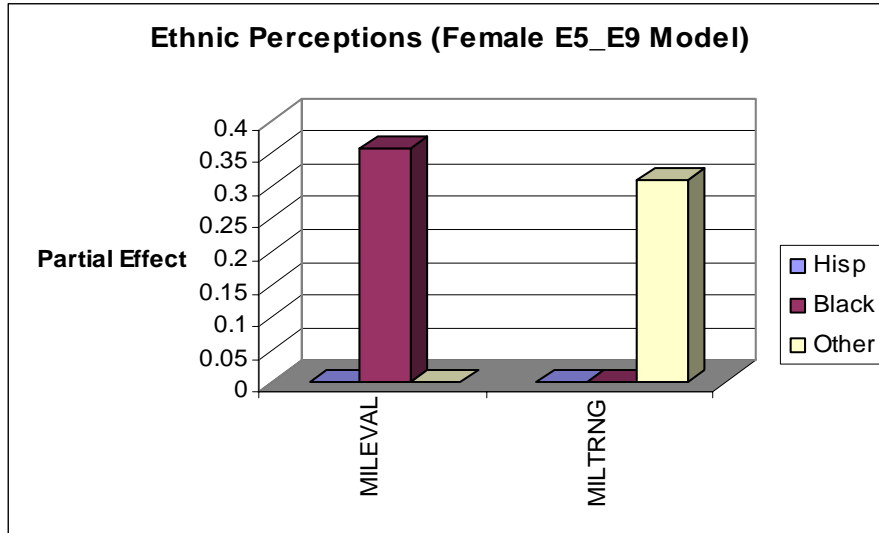

Source: Based on Regressions Performed on Data From the 1996 Armed Forces Equal Opportunity Survey.⁴⁵

Figure 14. Partial Effects for Significant Positive Variables (Female Officers)

8. Female Senior Enlisted Model

Figures 15 and 16 show the partial effects results for the senior female (E5-E9 enlisted and officer) models where the ethnic category of “other” represents the pooling of API and NTVAM respondents. The results in these figures, as was the case with the previous seven figures, only show the ethnic-perception interaction terms that were significant and positive. No conclusions can be drawn from the data regarding Hispanic senior enlisted women. Black senior enlisted women are more likely than their white counterparts to stay in service based on their perception that military evaluations are better. Other (API and NTVAM combined) senior enlisted women are more likely than their white counterparts to stay based on their positive perception of military training. The largest partial effect for these interaction terms in this model is the .36 increase in the probability of staying due to the perception of black senior enlisted women that military evaluations are better.

⁴⁵ The conditions are described in Table 1. HISP is Hispanic; Other represents the pooling of Asian/Pacific Islanders and Native Americans.

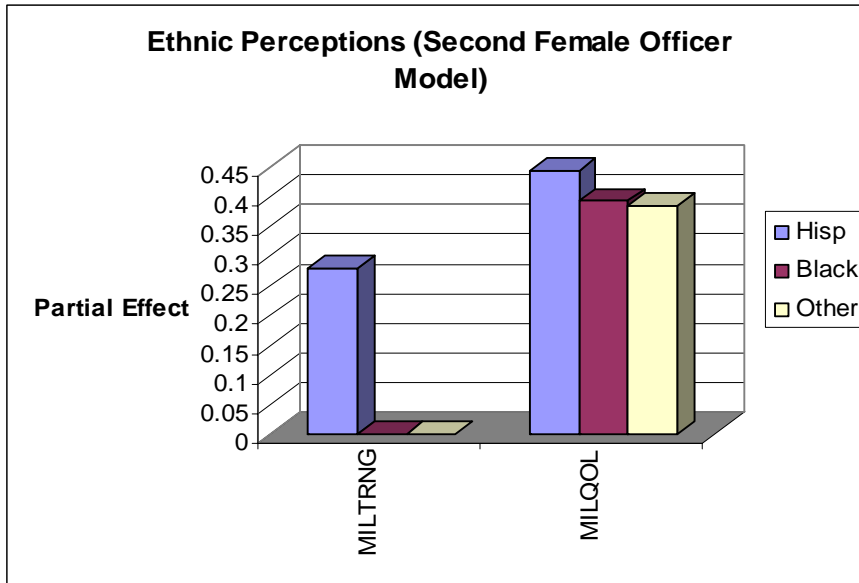

Source: Based on Regressions Performed on Data From the 1996 Armed Forces Equal Opportunity Survey.⁴⁶

Figure 15. Partial Effects for Significant Positive Variables (E5-E9 Women)

9. Second Female Officer Model

In the second female officer model, it can be seen that Hispanic female officers are more likely than their white counterparts to stay in service based on their positive perceptions of military training and quality of life. Black female officers and OTHER female officers are both more likely than their white counterparts to stay based on their perception that military quality of life is better. The largest partial effect for these interaction terms in this model is the .44 increase in the probability of staying due to the perception of Hispanic female officers that quality of life is better in the military.

⁴⁶ The conditions are described in Table 1. HISP is Hispanic; Other represents the pooling of Asian/Pacific Islanders and Native Americans.

Figure 16. Partial Effects for Significant Positive Variables (Female Officers in Senior Female Models)

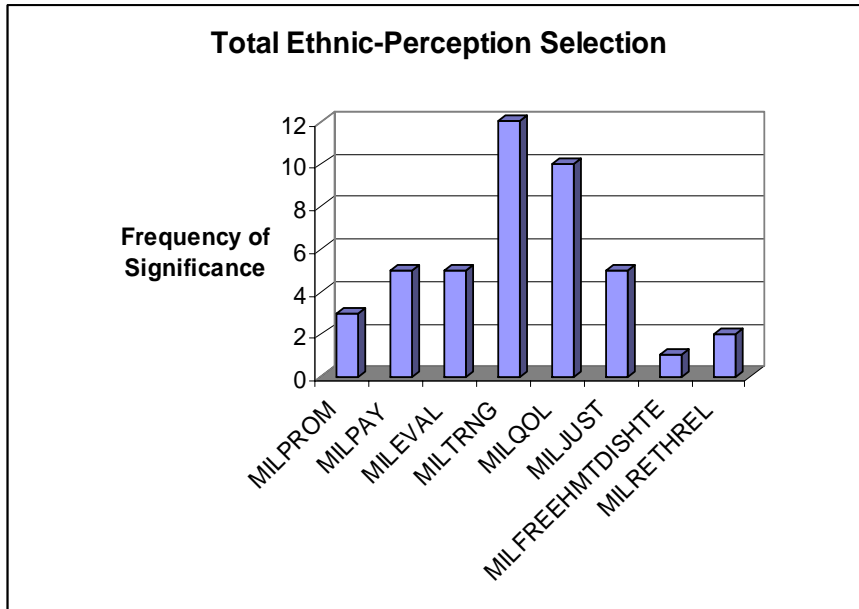

F. SUMMARY AND COMPARISON OF MODEL RESULTS

Figures 17 through 22 summarize and compare the model results.

1. Frequency of Perception Selection

As Figure 17 illustrates, positive perceptions of training opportunities were significant most often, across all of the racial/ethnic interactions and models. Second to training opportunities was the positive perception of military quality of life.

⁴⁷ Table 1 describe the conditions; HISP is Hispanic; and, Other represents the pooling of Asian/Pacific Islanders and Native Americans

Source: Based on Regressions Performed on Data From the 1996 Armed Forces Equal Opportunity Survey.⁴⁸

Figure 17. Frequency of Significance Across All Models

2. Racial/Ethnic Groups Most Strongly Influenced by Perceptions

Of the four minority groups in this study, blacks were most strongly influenced by perceptions in their retention plans. This finding is shown in Figure 18. While the frequency of significance peaked in three areas for blacks (evaluations, quality of life, and justice), Asian/Pacific Islanders peaked in two of these areas (evaluations and quality of life). As the frequencies seem to indicate, Hispanics and Native Americans were most influenced by military training opportunities.

⁴⁸ The conditions are described in Table 1.

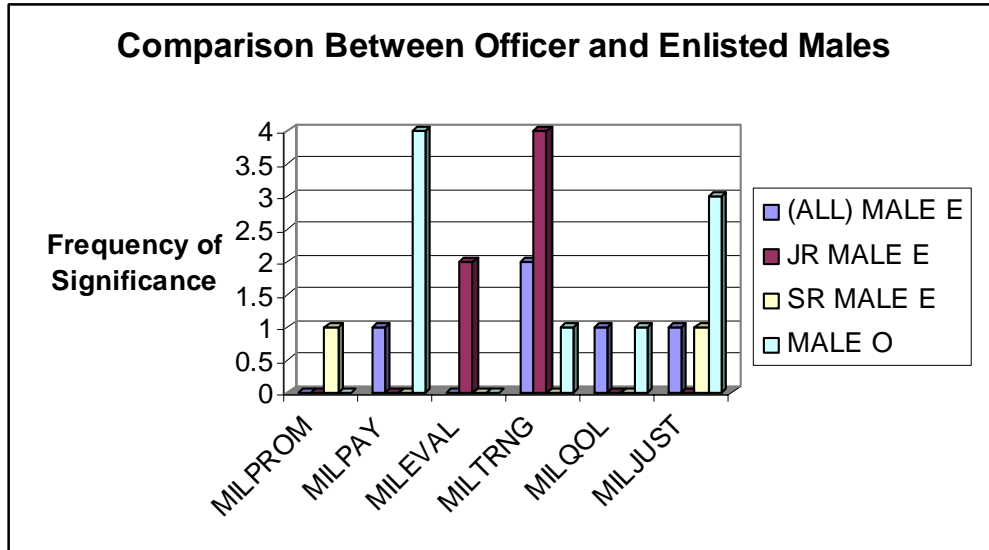

Source: Based on Regressions Performed on Data From the 1996 Armed Forces Equal Opportunity Survey.⁴⁹

Figure 18. Frequency of Perceptions Across Ethnic Groups

3. Comparison Between Officers and Enlisteds

Comparing the results of officers and enlisted personnel, it can be seen that enlisted men were most influenced by their perception of training opportunities whereas male officers were most influenced by their perception of pay.

⁴⁹ Table 1 describes the conditions. HISP is Hispanic; API is Asian/Pacific Islander; NTVAM is Native American; and, Other represents the pooling of and API and NTVAM.

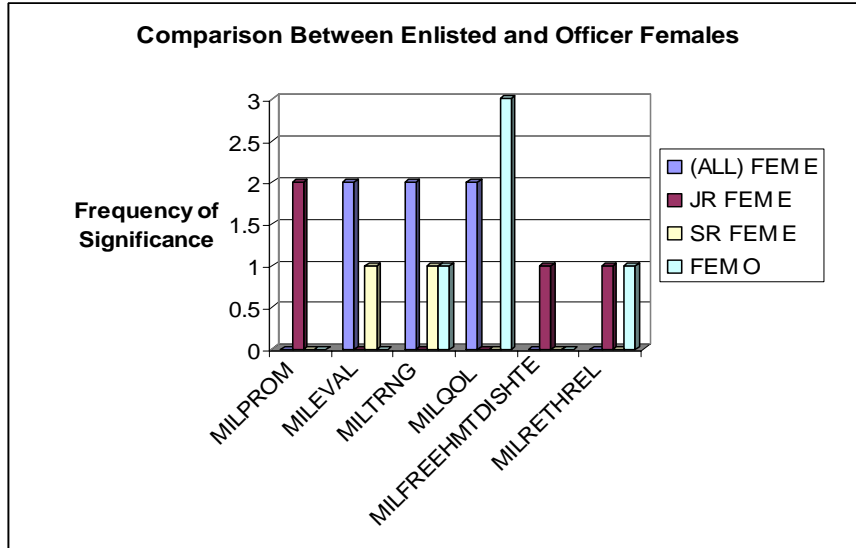

Source: Based on Regressions Performed on Data From the 1996 Armed Forces Equal Opportunity Survey.⁵⁰

Figure 19. Comparison of Perceptions Between Officer and Enlisted Males

Among female personnel, as seen in Figure 20, enlisted women were the most strongly motivated by their perceptions of evaluations and promotion opportunities; whereas, female officers were most strongly influenced by their perception of quality of life. Combined enlisted women’s perceptions peaked in two other areas, training opportunities and quality of life.

⁵⁰ JR is E1-E4; SR is E5-E9; E is enlisted; and O is officer.

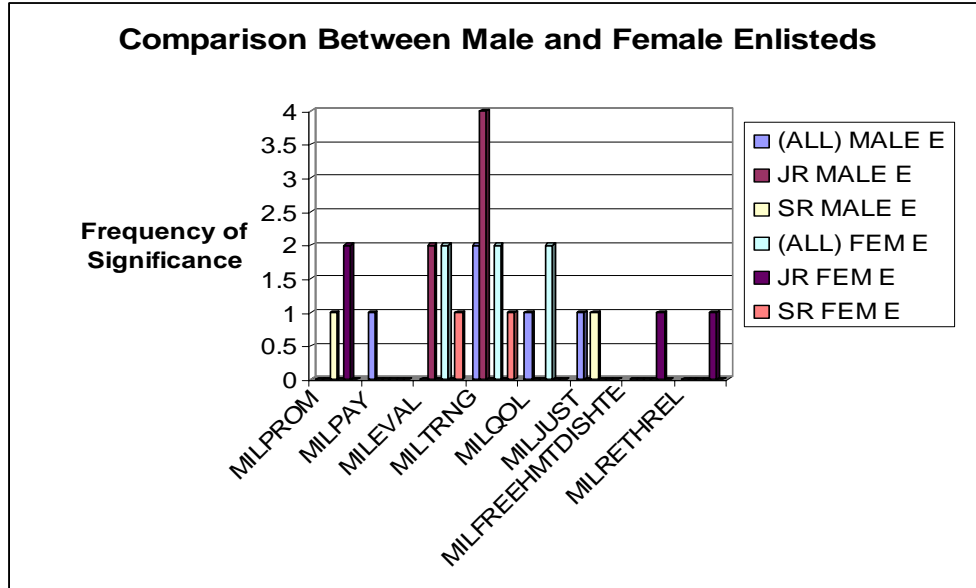

Source: Based on Regressions Performed on Data From the 1996 Armed Forces Equal Opportunity Survey.⁵¹

Figure 20. Comparison of Perceptions Between Officer and Enlisted Females

4. Comparison Between Males and Females

Figures 21 and 22 show the comparisons between men and women. In the enlisted ranks (see Figure 21), men were most strongly motivated by their perception of training; whereas, women were most influenced by their perceptions of evaluations and promotion opportunities. It can also be seen that positive perceptions of quality of life have a greater influence on enlisted women than on enlisted men.

⁵¹ Table 1 describes the conditions. JR is E1-E4; SR is E5-E9; E is enlisted; O is officer; and, FEM is female.

Source: Based on Regressions Performed on Data From the 1996 Armed Forces Equal Opportunity Survey.⁵²

Figure 21. Comparison of Perceptions Between Enlisted Men and Women

Among the officers (see Figure 22), however, men were most strongly influenced by their perceptions of pay while female officers were most strongly motivated by quality of life perceptions. The second highest area of influence for men was justice, while women’s secondary influence was shared equally by training opportunities and racial/ethnic relations.

Source: Based on Regressions Performed on Data From the 1996 Armed Forces Equal Opportunity Survey.⁵³

Figure 22. Comparison of Perceptions Between Male and Female Officers

⁵² Table 1 describes the conditions. JR is E1-E4; SR is E5-E9; E is enlisted; and, FEM is female.

⁵³ Table 1 describes the conditions. O is officer and FEM is female.

V. SUMMARY, CONCLUSIONS, AND RECOMMENDATIONS

A. SUMMARY AND CONCLUSIONS

This thesis draws information from the 1996 Armed Forces Equal Opportunity Survey and attempts to assess the relationship between perceptions of military opportunities by minorities and their intentions to remain in the U.S. Navy. The basic hypothesis is that positive perceptions of military opportunities, when compared with opportunities in the civilian sector, will influence minorities to stay in the Navy; conversely, comparatively stronger views of civilian opportunities will lead minorities to leave the Navy.

Logistic regression retention models were estimated for male and female enlisted personnel and officers. The results show that Hispanic and black enlisted personnel, Hispanic male officers, Asian/Pacific Islander male officers and female enlisted personnel, Native American male officers and Other female senior enlisted personnel are more likely to leave the Navy than are their white counterparts. On the other hand, Native American male enlisted personnel are more likely to stay in the Navy than are their white counterparts.

Model results also show that positive perceptions of the military on a variety of equal opportunity issues were also positive and significant determinants of personnel retention. In five of the nine models, the variables that indicate positive perceptions about military equal opportunity had the expected positive influence on the intent to stay in the Navy. This was especially true for military quality of life and military freedom from harassment, discrimination, and hate.

Interactions between specific perceptions and racial/ethnic groups were also included in the models to show how the effect of perceptions on retention varied by these groups. Results showed that training opportunities and quality of life were significant most often. Of the four minority groups considered in this research, blacks were most strongly influenced by perceptions in their retention plans. Second to blacks were Asian/Pacific Islanders, who were almost as strongly influenced by their perceptions.

The influence of certain perceptions varies by gender, pay grade, and minority group. In the enlisted ranks, minority men were most strongly motivated by their positive

perceptions of military training; minority women, on the other hand, were most influenced by their positive perceptions of military evaluations and promotion opportunities. Among officers, minority men were most strongly influenced by their perceptions of pay; in contrast, minority women were most strongly motivated by views on quality of life.

Officers and enlisted personnel are also influenced most strongly by different types of perceptions. For example, minority male enlisted personnel were most influenced by their positive perceptions of training opportunities, whereas their officer counterparts were most influenced by positive perceptions of pay. From this, it can be concluded that, as long as training opportunities for enlisted minority men are perceived as better than those available in the civilian sector, minority enlisted men will be influenced to remain in the Navy. Similarly, as long as pay and benefits are seen as more attractive in the military, minority male officers are more likely to remain on active duty.

Female minorities in the enlisted force were most strongly motivated by their positive perceptions of evaluations and promotion opportunities; in contrast, minority women officers were most strongly influenced by their positive perceptions of military quality of life. From this, it can be concluded that, as long as perceptions of military evaluations and promotion opportunities remain better in the military than in the civilian sector, female minorities in the enlisted force will be more likely to remain on active duty. Similarly, as long as quality of life is seen as more attractive in the military, minority women officers will be more likely to plan on staying in the service.

B. RECOMMENDATIONS

1. Policy Implications

This study suggests that positive perceptions about the military positively influence retention. With this understanding, one might ask: How can we change the EO climate so that it encourages more positive perceptions? For one thing, we can change “person perception,” which is defined by Muchinsky as “the processes by which

individuals form impressions and make inferences about other people.”⁵⁴ Figure 23 shows the “person perception” model.

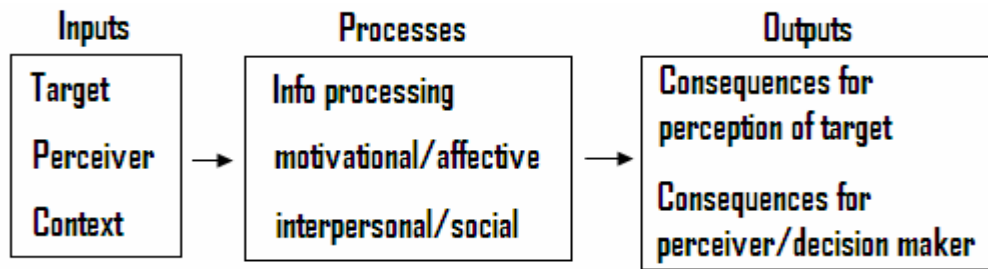

Figure 23. Input-Processes-Output Framework of Person Perception (From Muchinsky, 217)

This model indicates that training is the key to not only forming, but also correcting, perceptions. Basic to this approach is training personnel and leaders to recognize that communications (i.e., how something is said) and actions can be interpreted differently by different racial/ethnic groups. Part of the suggested training involves an understanding of the consequences for perceptions (adverse effects on workplace relationships and productivity) and the ramifications for violation of equal opportunity policies. The key here is to focus on building respectful relationships across genders and ethnicities, rather than focusing training on the more negative aspects of harassment, discrimination, and hate.

This study reveals that perceptions about equal opportunity issues had different effects on retention for different racial/ethnic minorities. Policies that promote an understanding of these effects and provide training for personnel on how their communications and actions may be interpreted by racial/ethnic minorities would lead to a better, stronger awareness of racial identity. An increased awareness of racial or ethnic identity may help shape positive perceptions of the military for sailors who are members of minority groups. A model that may be useful for organizational- based and individual- based awareness of racial/ethnic relations is that of Chrobot-Mason and Thomas (2002).

As seen in Figure 24, Chrobot-Mason and Thomas suggest that, if the development of the individual and the organization is on different levels of racial identity, a mismatch can occur that causes dissatisfaction and results in the member leaving the organization. If it is the organization that is on a higher plane (progressive), the

⁵⁴ Muchinsky, 216.

individual can be influenced to improve his or her level of racial identity development. However, if it is the member who is on a higher plane of development (regressive), he or she may become discouraged by the organization's lack of understanding and decide to leave rather than fight the system.

	Individual Racial Identity	
Organizational Racial Identity	Low Identity ←————→ High Identity Limited exploration of the meaning and significance of one's racial membership	High Identity Racial self-actualization (internalized sense of self)
Low Identity ↑ Racial differences are ignored or devalued (monocultural workplace)	Negative Parallel Interaction	Regressive Interaction
↓ High Identity Diversity is part of the overall business strategy (multicultural workplace)	Progressive Interaction	Positive Parallel Interaction

Figure 24. Interactive model of Individual and Organizational Racial Identity Development (From Chrobot-Mason and Thomas, 325)

In the instance where both the organization and the member are at low levels of development (negative parallel), neither benefit from the association. The best case scenario, which is difficult to maintain, is where both the organization and the member's racial identity are at high levels of development (positive parallel). Thus, an effort to foster the development of racial/ethnic identity at the individual and organizational levels could benefit the Navy by improving perceptions among minorities about the military.

Surveys such as the AFEOS and those at the unit level can be invaluable tools for leaders to use in determining where perception problems might exist and then address these issues directly. The difficult part, however, is in the design and interpretation of surveys. These assessments, combined with a basic understanding of the effects of perceptions, can go a long way toward ensuring that diversity is embraced and that identity development is at least progressive. An organization that is “proactive in recognizing, appreciating, and integrating diversity throughout its corporate strategy”⁵⁵ can use this diversity to its competitive advantage.

⁵⁵ Chrobot-Mason and Thomas, 327.

2. Further Study

The proportion of survey respondents who intend to reenlist is encouraging (about 56 percent), but more research needs to be conducted to ascertain how much of an impact the perceptions of equal opportunity have on a member's intent to stay. This would help to provide greater insight on what can be done to positively influence perceptions and maintain a high level of retention.

Given the interesting result that Hispanics and Native Americans are similar in how their perceptions influenced retention and that blacks and Asian/Pacific Islanders are likewise paired in their perceptions (at least in terms of the directionality), it might prove useful to identify the possible reasons for these similarities. It has been speculated that the pairings of racial/ethnic groups may be somehow related to job assignments or cultural similarities, or some other factor, such as the effect of visible versus non-visible minority status. Understanding relationships such as these would help explain how certain factors or characteristics affect perceptions, and might be particularly useful in changing perceptions for the better.

Since one of the factors that affect quality of life for military personnel is the amount of time spent away from home, information regarding perstempo/optempo (amount of time the member is actively engaged in executing a mission or deployed in support of a mission) could be useful in understanding the quality of life component of the survey. Other information, such as family status and years of service, could also influence one's intent to stay and might be useful in future analyses. Often, retention studies assess satisfaction variables such as satisfaction with job, training, promotions, and co-workers, to name just a few. However, these variables were not included in the perception models generated for this study because they were not the primary focus and because it is likely that the survey participants took these variables into consideration when they formed a view. Finally, further study of the relationship between satisfaction and perceptions might be useful in explaining the basis upon which these views are formed.

APPENDIX B. VARIABLE DESCRIPTIONS

Table 10. Regression Variable Descriptions, Based on 1996 Armed Forces Equal Opportunity Survey

Variable	Variable Descriptions
API	Minority group Asian Pacific Islander (recoded from survey's RETH variable)
API_MILEVAL	API interaction with perception of military evaluations being better
API_MILFREEHMTDISHTE	API interaction with perception of military freedom from harassment, discrimination, and hate being better
API_MILJUST	API interaction with perception of military justice being better
API_MILPAY	API interaction with perception of military pay being better
API_MILPROM	API interaction with perception of military promotion opportunities being better
API_MILQOL	API interaction with perception of military quality of life being better
API_MILRETHREL	API interaction with perception of military race/ethnic relations being better
API_MILTRNG	API interaction with perception of military training opportunities being better
BLACK	Minority group Black (recoded from survey's RETH variable)
BLACK_MILEVAL	Black interaction with perception of Military evaluations being better
BLACK_MILFREEHMTDISHTE	Black interaction with perception of Military freedom from harassment, discrimination, and hate being better
BLACK_MILJUST	Black interaction with perception Military justice being better
BLACK_MILPAY	Black interaction with perception Military pay being better
BLACK_MILPROM	Black interaction with perception Military promotion opportunities being better
BLACK_MILQOL	Black interaction with perception Military quality of life being better
BLACK_MILRETHREL	Black interaction with perception Military race/ethnic relations being better
BLACK_MILTRNG	Black interaction with perception Military training opportunities being better
E1_E4	Enlisted pay grades E1 through E4 (recoded from survey's XCPAY3 variable)
E5_E9	Enlisted pay grades E5 through E9 (from survey's XCPAY3 variable)
FEMALE	Female respondents (recoded from survey's Sex variable)
HISP	Minority group Hispanic (recoded from survey's RETH variable)
HISP_MILEVAL	Hispanic interaction with perception of Military evaluations being better
HISP_MILFREEHMTDISHTE	Hispanic interaction with perception of Military freedom from harassment, discrimination, and hate being better
HISP_MILJUST	Hispanic interaction with perception of Military justice being better
HISP_MILPAY	Hispanic interaction with perception of Military pay being better
HISP_MILPROM	Hispanic interaction with perception of Military promotion opportunities being better
HISP_MILQOL	Hispanic interaction with perception of Military quality of life being better
HISP_MILRETHREL	Hispanic interaction with perception of Military race/ethnic relations being better

Table 10. Regression Variable Descriptions (Continued)

Variable	Variable Descriptions
HISP_MILTRNG	HISP interaction with perception Military training being better
INTENT	If deciding on re-enlistment, likelihood would re-enlist (EQ9628 in binary)
MALE	Male respondents (recoded from survey's Sex variable)
MARRIED	Marital status (EQ9614 recoded into binary)
MILEVAL	Military evaluations are better (EQ9673C recoded into binary)
MILFREEHMTDISHTE	Military freedom from harassment, discrimination, and hate is better (EQ9673J recoded into binary)
MILJUST	Military justice is better (EQ9673F recoded into binary)
MILPAY	Military pay is better (EQ9673B recoded into binary)
MILPROM	Military promotion opportunities are better (EQ9673A recoded into binary)
MILQOL	Military quality of life is better (EQ9673E coded in binary)
MILRETHREL	Military race/ethnic relations are better (EQ9673L recoded into binary)
MILTRNG	Military training opportunities are better (EQ9673D recoded into binary)
NAVY	Military service component Navy (where survey's SVC variable = 2)
NTVAM	Minority group Native American (recoded from survey's RETH variable)
NTVAM_MILEVAL	Native American interaction with perception of Military evaluations being better
NTVAM_MILFREEHMTDISHTE	Native American interaction with perception of Military freedom from harassment, discrimination, and hate being better
NTVAM_MILJUST	Native American interaction with perception of Military justice being better
NTVAM_MILPAY	Native American interaction with perception of Military pay being better
NTVAM_MILPROM	Native American interaction with perception of Military promotion opportunities being better
NTVAM_MILQOL	Native American interaction with perception of Military quality of life being better
NTVAM_MILRETHREL	Native American interaction with perception of Military race/ethnic relations being better
NTVAM_MILTRNG	Native American interaction with perception of Military training opportunities being better
OTHER	API and NTVAM combined
OTHER_MILEVAL	Other interaction with perception of Military evaluations being better
OTHER_MILFREEHMTDISHTE	Other interaction with perception of Military freedom from harassment, discrimination, and hate being better
OTHER_MILJUST	Other interaction with perception of Military justice being better
OTHER_MILPAY	Other interaction with perception of Military pay being better
OTHER_MILPROM	Other interaction with perception of Military promotion opportunities being better
OTHER_MILQOL	Other interaction with perception of Military quality of life being better
OTHER_MILRETHREL	Other interaction with perception of Military race/ethnic relations being better
OTHER_MILTRNG	Other interaction with perception of Military training opportunities being better
OFFICER	All Officer paygrades (recoded from survey's XCPAY3 variable)
WHITE	Non-minority group White (recoded from survey's RETH variable)

APPENDIX C. LOGISTIC REGRESSION RESULTS

LOGISTIC REGRESSION W/ COMBINED ENLISTED MALE RESPONDENTS

Model Information

Data Set	WORK.EOS96
Response Variable	INTENT
Number of Response Levels	2
Number of Observations	11075
Link Function	Logit
Optimization Technique	Fisher's scoring

Response Profile

Ordered Value	INTENT	Total Frequency	
1	1	2557	NOTE: 327 observations were deleted due to missing values for the response or explanatory variables.
2	0	8518

Matching the calculation $((2557/11075)=.231)$, of number of intent being yes divided by the number of observations, against the probability level, tells us that this model correctly predicts about 86% of the time.

Partial Effects LOGISTIC REGRESSION W/ ENLISTED MALE RESPONDENTS

Model Information

Data Set WORK.BOTH
 Response Variable INTENT
 Number of Response Levels 2
 Number of Observations 11075
 Link Function Logit
 Optimization Technique Fisher's scoring

Response Profile

Ordered Value	INTENT	Total Frequency
1	1	2557
2	0	8518

NOTE: 374 observations were deleted due to missing values for the response or explanatory variables.

Model Convergence Status: Convergence criterion (GCONV=1E-8) satisfied.

LOGISTIC REGRESSION W/ ENLISTED MALE E1_E4 RESPONDENTS

Model Information

Data Set WORK.EOS96
 Response Variable INTENT
 Number of Response Levels 2
 Number of Observations 1585
 Link Function Logit
 Optimization Technique Fisher's scoring

Response Profile

Ordered Value	INTENT	Total Frequency
1	1	576
2	0	1009

NOTE: 129 observations were deleted due to missing values for the response or explanatory variables.

Matching the calculation $((576/1585)=.36341)$, of number of intent being yes divided by the number of observations, against the probability level, tells us that this model correctly predicts about 61% of the time.

LOGISTIC REGRESSION W/ ENLISTED MALE E5_E9 RESPONDENTS

Model Information

Data Set WORK.EOS96
 Response Variable INTENT
 Number of Response Levels 2
 Number of Observations 2836
 Link Function Logit
 Optimization Technique Fisher's scoring

Response Profile

Ordered Value	INTENT	Total Frequency
1	1	1981
2	0	855

NOTE: 198 observations were deleted due to missing values for the response or explanatory variables.

Matching the calculation $((1981/2836)=.69852)$, of number of intent being yes divided by the number of observations, against the probability level, tells us that this model correctly predicts about 53% of the time.

Model Information

Data Set	WORK.BOTH
Response Variable	INTENT
Number of Response Levels	2
Number of Observations	2836
Link Function	Logit
Optimization Technique	Fisher's scoring

Response Profile

Ordered Value	INTENT	Total Frequency	
1	1	1981	NOTE: 244 observations were deleted due to missing values for the response or explanatory variables.
2	0	855	

Model Convergence Status: Convergence criterion (GCONV=1E-8) satisfied.

Model Fit Statistics

LOGISTIC REGRESSION W/ COMBINED ENLISTED FEMALE RESPONDENTS

Model Information

Data Set WORK.EOS96
 Response Variable INTENT
 Number of Response Levels 2
 Number of Observations 2059
 Link Function Logit
 Optimization Technique Fisher's scoring

Response Profile

Ordered Value	INTENT	Total Frequency
1	1	381
2	0	1678

NOTE: 75 observations were deleted due to missing values for the response or explanatory variables.

Matching the calculation $((381/2059)=.185)$, of number of intent being yes divided by the number of observations, against the probability level, tells us that this model correctly predicts about 85% of the time.

Partial Effects LOGIT W/ COMBINED ENLISTED FEMALE RESPONDENTS

LOGISTIC REGRESSION W/ ENLISTED FEMALE E1_E4 RESPONDENTS

Model Information

Data Set WORK.EOS96
 Response Variable INTENT
 Number of Response Levels 2
 Number of Observations 446
 Link Function Logit
 Optimization Technique Fisher's scoring

Response Profile

Ordered Value	INTENT	Total Frequency
1	1	187
2	0	259

NOTE: 44 observations were deleted due to missing values for the response or explanatory variables.

Descriptive Statistics for Continuous Variables

Matching the calculation $((187/446)=.41928)$, of number of intent being yes divided by the number of observations, against the probability level, tells us that this model correctly predicts about 61% of the time.

Partial Effects LOGIT W/ ENLISTED FEMALE E1_E4 RESPONDENTS

Model Information

Data Set WORK.BOTH
 Response Variable INTENT
 Number of Response Levels 2
 Number of Observations 446
 Link Function Logit
 Optimization Technique Fisher's scoring

Response Profile

Ordered Value	INTENT	Total Frequency
1	1	187
2	0	259

NOTE: 90 observations were deleted due to missing values for the response or explanatory variables.

Model Convergence Status: Convergence criterion (GCONV=1E-8) satisfied.

Model Fit Statistics

Matching the calculation $((1603/2515)=.6374)$, of number of intent being yes divided by the number of observations, against the probability level, tells us that this model correctly predicts about 61% of the time.

Partial Effects LOGISTIC REGRESSION W/ MALE OFFICER RESPONDENTS

Model Information

Data Set WORK.BOTH
 Response Variable INTENT
 Number of Response Levels 2
 Number of Observations 2515
 Link Function Logit
 Optimization Technique Fisher's scoring

Response Profile

Ordered Value	INTENT	Total Frequency	
1	1	1603	NOTE: 174 observations were deleted due to missing values for the response or explanatory variables.
2	0	912	

Model Convergence Status: Convergence criterion (GCONV=1E-8) satisfied.

Matching the calculation $((291/467)=.6231)$, of number of intent being yes divided by the number of observations, against the probability level, tells us that this model correctly predicts about 49% of the time.

Partial Effects LOGIT W/ FEMALE OFFICER RESPONDENTS

Model Information

Data Set	WORK.BOTH
Response Variable	INTENT
Number of Response Levels	2
Number of Observations	467
Link Function	Logit
Optimization Technique	Fisher's scoring

Response Profile

Ordered Value	INTENT	Total Frequency	
1	1	291	NOTE: 77 observations were deleted due to missing values for the response or explanatory variables.
2	0	176	

Model Convergence Status: Convergence criterion (GCONV=1E-8) satisfied.

0.660	91	56	45	103	49.8	46.9	55.4	33.1	64.8
0.680	78	65	36	116	48.5	40.2	64.4	31.6	64.1
0.700	77	65	36	117	48.1	39.7	64.4	31.9	64.3
0.720	73	74	27	121	49.8	37.6	73.3	27.0	62.1

Matching the calculation $((194/295)=.65763)$, of number of intent being yes divided by the number of observations, against the probability level, tells us that this model correctly predicts about 50% of the time.

Partial Effects LOGIT W/ FEMALE E5_E9 ENLISTED RESPONDENTS

Model Information

Data Set	WORK.BOTH
Response Variable	INTENT
Number of Response Levels	2
Number of Observations	295
Link Function	Logit
Optimization Technique	Fisher's scoring

Partial Effects LOGIT W/ FEMALE E5_E9 ENLISTED RESPONDENTS

Response Profile			
Ordered Value	INTENT	Total Frequency	
1	1	194	NOTE: 68 observations were deleted due to missing values for the response or explanatory variables.
2	0	101	

Model Convergence Status: Convergence criterion (GCONV=1E-8) satisfied.

Matching the calculation $((291/467)=.6231)$, of number of intent being yes divided by the number of observations, against the probability level, tells us that this model correctly predicts about 50% of the time.

1. Demographic and Military Control Variables

Table 11 also shows that the married variable was significant across all of the enlisted male models. According to these results, on average, all married enlisted males are .375 more likely to stay than their single counterparts. When separated into paygrade groups, junior enlisted married males, on average, were .14 more likely to stay than their

single counterparts; whereas, senior enlisted married males were .07 more likely to stay than their single counterparts.

The E1_E4 variable in the combined enlisted male model was positive and significant. From the results, junior enlisted males in this model are, on average, .026 more likely than their senior counterparts to remain on active duty.

2. Race/Ethnic Group Variables

As indicated in Table 11, the Hispanic and Black ethnic variables were only significant in the combined enlisted male model (but not in either of the other enlisted male models); Asian Pacific Islanders were not significant in any of the enlisted male models; and Native Americans were significant across all of the enlisted male models. The all enlisted male model reflected that Hispanics are .017 less likely to stay than White enlisted males; whereas, Blacks are .02 less likely to stay and Native Americans are .03 more likely to stay than their White male counterparts. In both the junior and senior enlisted male models, Native Americans were .074 more likely to stay than their White counterparts.

3. Perception Variables

Looking at the perception variables, MILPAY had a positive (.14) effect in the all in the junior enlisted male model. MILTRNG had the expected positive effect in the all male and senior enlisted male models (.058 and .11 respectively). MILQOL had a positive effect in the junior and senior enlisted male models (.18 and .09 respectively). MILFREEHMTDISHTE had positive effects in the all and senior enlisted male models (.03 and .08 respectively); but, was not significant in the junior enlisted male model. MILRETHREL had a positive effect of .06 in the all enlisted male model.

4. Interactions between race/ethnic group and perception variables

In terms of the ethnic-perception interaction variables, none were found to be significant across all of the enlisted male models; however, seven of these variables were significant in two of the three models. Only two of the eight Hispanic interaction variables, six of the eight Black interaction variables, five of the eight Asian Pacific

Islander interaction variables, and four of the eight Native American interaction variables were significant in the enlisted male models.

MILPROM had a positive effect (of .2) on Asian Pacific Islander E5-E9 males' intent to stay in the Navy. Although MILPAY had a positive effect (of .05) on the combined enlisted Black males' intent to stay on active duty, it took on a negative sign for E1-E4 enlisted Asian Pacific Islander males. MILEVAL had positive effects on junior enlisted Black and Asian Pacific Islanders males' intent to stay Navy (.2 for both). MILTRNG had positive effects on Hispanic and Black males in the all enlisted male model and on E1-E4 Hispanic, Black, Asian Pacific Islander, and Native American males' intent to stay on active duty (.03, .16, .05, .15, .15, and .14 respectively). However, as the regression results indicate, military training took on a negative sign for E5-E9 male Asian Pacific Islanders' intent to stay in the military. MILQOL had a positive (.06) effect on the intent of Native Americans in the all enlisted male model and took on a negative sign for E1-E4 Black males. MILJUST had positive effects on the intent of Black males in the all enlisted male model (.04) and the E5-E9 male model (.17), and took on a negative sign for Native Americans in the all enlisted male model and the E1-E4 male model. MILFREEHMTDISHTE took on a negative sign for Black males in the all enlisted male and the E5-E9 male models. The last of the variables to interact with the ethnic groups and impact the intent to stay Navy, MILRETHREL, took on a negative sign for Hispanic males in the all enlisted male model; Asian Pacific Islander males in the all enlisted male and E5-E9 male models; and, Native American males in the all enlisted male model.

B. ENLISTED FEMALE MODELS

Table 12 shows the partial effects for the combined Enlisted female model and for the junior enlisted (E1-E4) female model. As the table indicates, the Hispanic, Black, and API variables were significant in the all enlisted female regression; but, none of these ethnic variables were significant in the junior female model. Only one of the perception variables (MILJUST) was significant across both of these enlisted female models. Only two of the eight Hispanic interaction variables, four of the eight Black interaction variables, four of the eight Asian Pacific Islander interaction variables, and five of the

eight Native American interaction variables were significant in these enlisted female models.

1. Demographic and Military Control Variables

Married enlisted females, in the all enlisted female model, are .24 more likely to stay on active duty than their single counterparts. E1-E4 females in the all enlisted female model are .08 more likely to stay than senior enlisted females.

2. Race/Ethnic Group Variables

According to the results of the partial effects, Hispanic, Black, and Asian Pacific Islander females in the all enlisted female model are, on average, .03 less likely than their White counterparts to stay in the Navy.

3. Perception Variables

Among the perception variables, MILTRNG had a positive effect in the all enlisted female model (.07), MILQOL had a positive effect in the E1-E4 female model (.41), MILJUST had a positive effect in both the all enlisted female model and the E1-E4 female model (.18 and .39 respectively), and MILRETHREL had a positive effect in the all enlisted female model (.08).

4. Interactions between race/ethnic group and perception variables

In the ethnic-perception interaction variables, MILPROM had a positive effect on E1-E4 black and Native American females' intent to stay in the Navy (.43 and .47 respectively). MILEVAL had positive effects on the intent to stay for both black and Asian/Pacific Islander females in the all enlisted female model (.43 and .25 respectively). MILTRNG had positive effects on the intent to stay for both Hispanic and Native American females in the all enlisted female model (.1 and .14 respectively). While MILQOL had positive effects on Black (.18) and Asian/Pacific Islander (.17) females' intent to stay in the military in the all enlisted female model, it took on a negative sign for Native American females in the E1-E4 female model. In the all enlisted female model, MILJUST took on negative signs for Hispanic, Asian/Pacific Islander, and Native American females. MILFREEHMTDISHTE had a positive effect (.64) on Asian/Pacific Islander females in the E1-E4 female model. The last interactive perception variable, MILRETHREL, had a positive effect (.47) on the intent of Native American females in the E1-E4 female model.

C. OFFICER MODELS

Table 13 compares the partial effects for the male and female officer models.

1. Demographic Control Variable

As Table 13 shows, the married variable has a positive effect in the male officer model which means that married male officers are .21 more likely than their single counterparts to stay on active duty. This variable was not significant in the female officer model; therefore, no conclusions can be drawn regarding the effect of marriage on female officers.

2. Racial/Ethnic Group Variables

According to these results, Hispanic, Asian/Pacific Islander, and Native American male officers are less likely than their White counterparts to stay on active duty (-.12, -.1, and -.17 respectively), *ceteris paribus*. Since the black variable was not significant in the male officer model, no conclusions can be inferred from this variable relative to male officers. Given that none of the race/ethnic variables were significant in the female officer model, no inferences can be drawn regarding the estimates for these variables relative to female officers.

3. Perception Variables

Only four of the eight non-interactive perception variables were significant in these officer models (MILPAY, MILEVAL, and MILQOL in the male officer model; MILQOL and MILFREEHMTDISHTE in the female officer model). Two of these variables took on a negative sign (MILPAY was negative in the male officer model and MILQOL was negative in the female officer model); whereas, the others were positive (MILEVAL and MILQOL had positive effects (.17 and .13 respectively) in the male officer model and MILFREEHMTDISHTE had a positive effect (.24) in the female officer model).

4. Interactions between race/ethnic group and perception variables

For the Hispanic interaction variables, MILPAY and MILJUST had positive effects on Hispanic male officers' intent to stay on active duty (.25 and .13 respectively); but, MILEVAL took on a negative sign for this group. MILTRNG and MILQOL had positive effects on Hispanic female officers' intent to stay on active duty (.28 and .44 respectively).

The results for Black interaction variables show that MILPAY and MILJUST had positive effects on Black male officers' intent to stay on active duty (.27 and .12 respectively). MILQOL had a positive (.39) effect on Black female officers' intent to stay on active duty.

For the Asian Pacific Islander interaction variables, MILPAY and MILQOL had positive effects on API male officers' intent to stay on active duty (.24 and .25 respectively); whereas, MILEVAL took on a negative sign for API male officers. Since

they were not significant in the female model, no inferences can be drawn regarding the effect of API interaction terms on female officers' intent to stay on active duty.

The results for Native American interaction variables show that MILPAY, MILTRNG, and MILJUST had positive effects on NTVAM male officers' intent to stay on active duty (.26, .13, and .1 respectively). MILQOL and MILRETHREL had positive effects on NTVAM female officers' intent to stay on active duty (.39 and .25 respectively); whereas, MILFREEHMTDISHTE took on a negative sign for NTVAM female officers.

D. ALTERNATIVE MODELS FOR SENIOR FEMALES

Table 14 compares the partial effects results of the senior female (E5-E9 enlisted and officer) models wherein the ethnic category of “other” represents the pooling of the API and NTVAM respondents.

1. Demographic Control Variable

Since the MARRIED variable was not significant in either of these two models, no conclusions can be drawn regarding the effect of being married for these personnel.

2. Race/Ethnic Group Variables

The results in this table reveal that the senior enlisted female personnel in the OTHER category are .2 less likely to stay than their White counterparts.

3. Perception Variables

Only two perception variables were significant in these models. MILQOL and MILFREEHMTDISHTE had positive effects (.32 and .33 respectively) on the senior enlisted female intent to stay on active duty. MILFREEHMTDISHTE had a positive effect (.25) on female officers’ intent to stay on active duty; whereas, MILQOL took on a negative sign for female officers.

4. Interactions between race/ethnic group and perception variables

For the Hispanic interaction variables, MILTRNG and MILQOL had positive effects (.28 and .44 respectively) on Hispanic female officers’ intent to stay on active duty. MILFREEHMTDISHTE took on a negative sign for Hispanic female E5-E9 personnel.

The results for black interaction variables show that MILEVAL had a positive effect (.36) on black female E5-E9 personnel’s intent to stay on active duty; whereas, MILFREEHMTDISHTE took on a negative sign for black female E5-E9 personnel. MILQOL had a positive effect (.39) on black female officers’ intent to stay on active duty.

For the Other interaction variables, MILTRNG had a positive effect (.31) on Other female E5-E9 personnel’s intent to stay on active duty; whereas,

MILFREEHMTDISHTE took on a negative sign for Other female E5-E9 personnel. MILQOL had a positive effect (.38) on Other female officers' intent to stay on active duty; whereas, MILFREEHMTDISHTE took on a negative sign for Other female officers.
