DESIGN AND IMPLEMENTATION OF VISUAL INTERFACE TO DATABASE

Suprapto

Master's Thesis

FROM 09/90 TO 09/91

September 1991

Visual interface, Visual programming, Software Development Tools

Traditional approaches to database system design and implementation involve text-oriented data access with their inherent lack of modularity, extensibility and modifiability. An alternative to this traditional approach is using visual interface for the design and implementation of databases. This alternative approach involves using software development tools(toolkits) to ensure modularity, extensibility and modifiability. To study the effectiveness of using visual interfaces, we have designed and implemented a sample application using KnowledgePro(Windows), a tool for rapid application development under Windows.

I. INTRODUCTION

A. MOTIVATION

Recent advances in science and technology have made high-resolution graphics an available presentation medium on mainframes and personal computers. Tremendous advances in computer hardware have also contributed to the demand for software applications which take advantage of these hardware capabilities. As a result of these changes is the flourishing of database applications employing visual interactions as means of communication between users and their data base systems.

Almost all traditional programming languages developed to date have a text-based syntax and structured modularized software development approach. Creating a graphical display in traditional approach is to write program which accepts parametized input, examine a database, and then make calls to a graphic subroutine package to create the desired display. This approach involves using relatively low level procedural languages such as Ada, or C. The complex nature of Visual Interface software requires unacceptable amounts of time to design, code, test and maintain the software.

By using a relatively a new approach, this time problem can be overcome. This new approach involves using Software Development Tools (toolkits) to develop Visual Interface software. Toolkits should be designed to ensure reusability, modifiability and extensibility. That also means, the tools should help ensure consistency, ease of maintenance, and expedient implementation. These characteristics should be used as
criteria for selecting a toolkit. Typically, these toolkits provide a collection of standard objects that should be powerful enough to be used to build visual interfaces with small amounts of code. For these reason, it is necessary for database managers to find a toolkit that support the desired characteristic.

Many different Visual Interface Development Tools have been proposed in recent years. One of the promising toolkit that supports the desired characteristics is KnowledgePro (Windows). KnowledgePro (Windows) contains high-level commands for manipulating screen objects. It also utilizes direct manipulation of objects in the database, which extremely facilitates using and learning the system.

The goal of this thesis is to study the ease and the effectiveness of visual interface development tools. To achieve the goal, we demonstrate the design and implementation of prototype application Emphasis Area Information System (EAIS) using toolkit KnowledgePro(Windows). This system includes the required and optional electives for each emphasis area supported by the database system which enables Computer Science personnel to select elective from an interactive scheduling program.

B. THESIS ORGANIZATION

Chapter II will address some background information for the thesis, beginning with a discussion of visual interface. Discussion will include visual programming, the categories of visual programming, the advantages and disadvantages of each category in general. We then present the features of window interface and, finally, the overview of KnowledgePro(Windows).
Chapter III will include a discussion of a prototype implementation created with KnowledgePro (Windows). The discussion will describe the problem statement, the goals of design and implementation, the Emphasis Area Information System, using the proposed software KnowledgePro (Windows).

Chapter IV will evaluate the application development process. We then discuss the category of KnowledgePro (Windows), its advantages and disadvantages compared to other Visual Interface Development Tools Toolbook. Finally, chapter V will present the conclusion of the research.
II. BACKGROUND

In this chapter, we describe some background information of the thesis. Section A looks at the significance of visual interface for human being. Section B discusses the features of window interface. The final discussion is an overview of corresponding software development tools which is used in our research.

A. VISUAL INTERFACE

During the human-computer interaction, most information conveyed by computer is presented visually, typically by means of dynamic display device. Today, the majority of these devices are cathode ray tubes (CRTs), although other devices such large-scale liquid-crystal displays may be more common in the future. No matter what display technology is used, the content and format of information presented will always have substantial impact on the usefulness and efficiency of the interaction. In the human-computer interaction, visual interface affects both the user initial impression of the interface and system’s longer-term usefulness. Visual interface comprises all the graphic elements of interaction, including overall screen layout, menu and form design, use of color, information codings, and placement of individual units of information with respect to one another. Therefore, graphical displays play important role in visual interactions.

The trend in the design of a database systems is towards more visual forms of interaction. The means of communication is no longer simple comprehension of written words, but interpretation of visual and spatial properties of graphical items including
icons, windows and menus. We believe a visual interface holds a best potential as a end-user interaction tool.

In recent years, many visual interface to database systems have been proposed (Hero 1980, Lars 1984, Wu 1986, Wu 1987, Wu 1988) with different approaches and different designs. Good visual interface design strives for clarity, consistency, and attractive appearance (Foley, 1987). Wu and Hsiao (1988) have identified six principles for the development of visual interface design GLAD (Graphics LAnguage for Database). The program should be able to:

- Provide more information when asked.
- Recover from the unintended or erroneous operation.
- Perform the same operation in more than one way.
- Perform logically equivalent operations in a consistent manner.
- Display multiple information at the same time.
- Display multiple views of the same information.

The important of visual interface design has been demonstrated in a variety of studies. For example, Tullis (1981) found that redesigning a key display from a system for testing telephone lines resulted in a 40% reduction in the time required by the user to interpret the display. Wu and Hsiao (1988) found that designing GLAD interface utilizes direct manipulation of objects in the database through the use of buttons and other controls which make using and learning the system extremely easy. Likewise, Keister and Gallaway (1983) found that redesigning a series of screens resulted in a 25% reduction
in the total processing time and a 25% reduction in error rates.

Visual information such as graphical representation and pictures are more powerful than words as means of communication. Graphics and pictures also aid understanding and remembering. In this section we discuss visual programming, the categories of visual programming and its advantages and limitations each category in general.

1. Visual Programming

In the early days of the interactive computing when the hardware and software were limited, system designers focused on processor efficiency, commonly more at the expense of the user than on the human convenience. Additionally, as we stated in chapter I, almost all traditional languages were not designed for visual interactions.

However, as hardware costs dropped and computer systems became more widespread, data set sizes grow, algorithms become more complex, the cost of user’s time greatly increase. The price of RAM chips fell enough to accommodate the huge memory demands of bit-mapped graphics. These hardware and personnel costs, coupled with competition in the marketplace, and the need of visualization systems, have caused designer to focus on human-computer interface. This situation gives challenge to designer to bring computer capabilities more powerful than currently available, usefully and simply to the user without special training.

As a result, in recent years, the use of visual information has gained momentum in programming. This kind of programming, called visual programming, is done through visual interaction with the system. Visual programming provides more direct communication between a person and a machine and makes it easier to create programs.
Visual programming makes greater use of extensive visual information processing capabilities of human, and by doing so, provide for totally new types of human-computer interaction (Tullis, 1988).

2. The Categories of Visual Programming

Programming can be defined as specifying a method for doing something the computer can do, especially in terms the computer can interpret. To attempt the ease of programming, of course, is not new. People have been trying to design or improve programming language for the ease of use and the ease of learning for several years. However, language design has been evolutionary rather than revolutionary. Since programming is currently to be made more accessible to people, it become apparent that radical departure from traditional programming into visual programming.

They are several aspects of programming: the languages and environment used for the specifications; the specifications themselves; the display of data involved in the execution of the specifications; the determination of whether the computer has executed a specification as expected; etc. All aspects of programming can be applied by visual programming. To determine whether a specific software is visual programming or not, is the consideration of some meaningful graphical representations must be used in the programming process.

From the recent work reported in the literature, we see that visual programming progress in two directions. In one direction, languages are designed for handling visual information; for supporting visual interactions; and for programming with visual expressions. In another direction, pointing devices and graphical representations are
used to provide visual environments for program development and execution; for information retrieval and presentation; and for software design and understanding (Nan C. Shu, 1988).

a. Languages for handling Visual Information

This language is designed to process image or pictorial information. The image processing systems designed for handling of two-dimensional pictorial data that can be applied for specific purpose such as an engineering, a geographical, a medical and a scientific applications. Now, incorporation between conventional database query languages and image processing systems have already be implemented as augmented conventional query languages. Languages fall into this category are GRAIN (the Graphic-oriented Relational Algebraic INterpreter), QPE (Query-by-Pictorial-Example), QBE (Query-by-Example), PSQL (Pictorial Structured Query Language).

The benefits of the system that it can store and retrieve pictorial information into database. The system also includes zooming technique, such as vertical zoom, horizontal zoom and diagonal zoom, makes the system extremely attractive. The complexity increases when we have a large number of pictures or very large pictures.

b. Languages for supporting Visual Interaction

Languages in this category are mainly designed to define, create, and manipulate pictorial symbols. It is also called Iconic Programming. They are motivated by the need to have the ease of using and manipulating of pictorial data. The languages that fall in this category, generally support visual representations and visual interactions.
Although the languages themselves are actually textual, not visual. Languages fall into this category are ICDL (icon-class description language), HI-VISUAL, and Squeak. ICDL is language that consists of several statements. Each statement accepts some value and performs some graphical operation. HI-VISUAL is a language supporting visual interaction in programming. Squeak is a language supporting communication with a pointing device.

The advantage of this approach over textual programming is that it can make learning and understanding easier, especially for non-computer specialists. Iconic is effective for introductory courses in languages. Hirakawa, Tanaka, Ichikawa (1984) proved through an experiment that iconic languages are easier to learn than textual one. Iconic programming may be good for small programs. In contrast, iconic programming is the wasteful use of screen space. It make difficult to make a large program.

c. Languages for programming with visual expressions

Languages that fall into this category, focus on allowing users to program with visual expressions. These languages are usually called the "visual programming languages". They use some visual representations (textual, numeric, pictorial or audio) as means of programming. Almost all visual programming languages reported from literature fall into three categories. First category is Iconic languages. In Iconic languages, icons and graphical symbols are designed to play the central role in programming. Second, Charts and Diagrams are either incorporated into programming development, or made into machine-interpretable units to be used in conjunction with traditional programming languages. Third, Form-based languages lie between chart/diagrams and iconic languages.
d. **Visualization of Data or Information about Data**

This approach typically concentrates in the environment area which deals with visualization of data or information about data. The data are kept in traditional databases. It expressed in graphical form and presented to the user in a spatial framework. Tools are provided which allow the user to make connection between data from these sources and their associated graphical representations. By using pointing device or joystick the user directly manipulates data in the databases. The examples of this category are SDMS (Spatial Data Management System), VGQF (Video Graphic Query Facility), INCENSE (a System for Displaying Data Structures) etc.

e. **Visualization of Program/Execution**

Languages in this category primarily designed to provide graphical representation for the visualization of programs, run time states and results. The goal is to use graphical displays to make the program development and testing easier. This is benefits not only to beginners learning how to program, but also to experience programmer dealing with program development. Activities in this area span from "pretty-printing" the source code, watching the execution program in multiple displays or in animated forms.

f. **Visualization of Software Design**

There are many activities in the software development process. The activities include requirement analysis, functional specifications, design decisions, implementation, system structures. Languages that fall into this category provide graphical
forms in the software development environment. People who design, use, or maintain interact graphically with the system. The examples of this category are PeaSys (Programming Environment for the Graphical Analysis of SYStems), PV (Program Visualization) system.

**g. Visual Coaching**

Visual Coaching actually attempts to produce program based on what has been shown. It can be characterized as "Do what I show you" or "Do according to my signal." Typically, the users show the computer how to do the desired computation by demonstrating with some sample data. The system then applies the demonstrated behavior for application with other data. Program development completely depends on interactions. Languages that fall into this category are Programming By Example, Programming By Rehearsal, AutoProgramming.

There are several advantages using this approach. This approach attempts to extend ideas to abstract concepts in programming. Because most people are much better dealing with concrete and specific objects than with abstract ideas. So, by demonstration and examples can help people to understand abstract concepts. The users find it easily to demonstrate what they want done. Additionally, this approach can assist the thinking and learning process of human beings. This approach relies on graphical interactions, so that program construction can be easy, quick, and enjoyable. On the other hand, this approach has limitations. First, physical limitations imposed by the space on the screen. Second, the difficulties to express an ideas in more abstract and general terms.
B. WINDOW INTERFACE

Windowing interfaces got their start at the XEROX Palo Alto Research Center (PARC) in the mid-1970's. In 1984, they were popularized by Apple Computers, particularly the Macintosh line, and later, followed by Microsoft and other developers. Window interfaces has become popular primarily because they allow separate activities to be put in physically separate parts of the computer screen. This physical separation is even more important when the operating system allow multiple activities to operate at the same time ("multiprocessing"). Window interface provides many of the important features of modern user-computer interfaces applications that show results in different areas of the display, the ability to resize the screen areas in which those applications are executing, pop-up and pull-down menus, and dialogue boxes, the ability of repositioned windows. Now, many windowing interfaces offer command-key or keyboard alternatives for many commands as well, providing both ease of use for novices and the less experienced, and speed for who can type faster than they point to menu and click on a selection.

Window interface has two important parts. The first is the window manager, which allows the user to interact with computer, request that windows be created, resized, repositioned, opened, and so on. The second is the underlying functional component, the window system, which actually causes windows to be created, resized, moved, and so on.

1. Window Manager

The window manager uses user-interface services provided by the window system, promotes consistency and makes application easier. This includes all aspects that are visible to user such as a graphic package, editors, users interface tool kits, typescript
package, etc. The window manager consists into two parts: the presentation, which is composed of the pictures that the window manager displays, and the operations, which are the commands the user can give to manipulate the window and their contents. For example windows that demonstrate different aspects of the presentation, including patterns or pictures for the area where there are no windows, title lines and border for windows, etc may be provided. The operations for windows include moving them around on the screen and specifying their size.

One important aspect of the presentation of the window is whether they can overlap or not. This also some time called desktop metaphor, since windows can cover each other like pieces of paper can cover on the desktop. The other alternative is called tiled windows, which means that windows are not allow to cover each other. Some researchers still question whether overlapping windows offer more benefits than tiled, at least above a certain screen size, on the grounds that screens with overlapping windows become so messy the user gets lost. Others argue that overlapping windows more closely match user's work patterns, since no one arranges the papers their physical desktop in neat horizontal and vertical rows. Among software engineers, however, overlapping windows seem to have won for the user interface world(Tekla s. Perry, and J., Voelcker 1989). Another important aspect of the presentation of the window is the use of icons. These are small pictures that represent windows, to manage too many windows conveniently.
2. Window Systems

Window systems implement the basic functionality of the window interface. They handle the display of graphics in windows and access to the various input devices (usually a keyboard and a pointing device such as a mouse). The primary interface of window systems is to other programs, and it is called the manager’s application or program interface. The programs built on the window systems are usually called client program, which in turn use the capabilities of the window system, itself usually called the server program. A graphics package is often integrated with the window system. Figure 2.1 shows how the window system and its graphics package typically relate to other system component.

![Diagram of the Window System](image)

**Figure 2.1 The Window System**
C. KNOWLEDGEPRO(WINDOWS)

Today, several application development tools for Windows 3.0 are available in the marketplace. Some products, like Asymetrix ToolBook offer a development environment for sophisticated end-users. Others, like Whitewater Group’s Actor are designed for programmers. One that fulfills the needs of both groups is KnowledgePro(Windows).

KnowledgePro(Windows) combines several significant new technologies in a remarkably accessible toolbox:

• Windows development capabilities
• hypertext and hypermedia access
• expert system strength

This technology makes it possible to create Windows applications that combine the ability to link among various elements of a collection of information, to enhance the end-user interface. It also makes it possible to build Windows programs that can exhibit behavior that would probably agree demonstrates at least rudimentary intelligence. (Dan Shafer, 1989)

The following, we discuss how to start KnowledgePro, user interacts with computer, and some tools provided by KnowledgePro.

1. Getting Started

Figure 2.2 shows the development environment running a simple application. KnowledgePro(Windows) includes an integrated, multiple-document editor for easy manipulation of source code and text. We can run quickly just by selecting Go from the menu. Whenever an error occurs, we are return to edit window at the line which caused
the problem. KnowledgePro(Windows) provides a full set of debugging tools, including Trace, Single-step and the ability to interact with running application.

![KnowledgePro Development Environment](image)

**Figure 2.2 KnowledgePro Development Environment**

The backbone of KnowledgePro(Windows) is KnowledgePro language: an event-driven, message-based language with object oriented features like multiple inheritance. Language, editor and tools provided by Knowledge processing environment, let the user communicate expertise using the computer. The program that the user creates in this environment is called Knowledge base. The example of Knowledge base is shown below:

```
window().
```
content is '#e #mIntroduction#m

#mMotivation#m

#mThesis Organization#m'.

text(?contents).

topic mark(item).

message is read('course.txt', concat(''/?item)'//')).

close('course.txt').

say(?message).

text(?contents).

end.

Each Knowledge base consists of one or more topics that contain commands, functions, and subtopics. These topics perform actions, prescribe a behavior, or service hypertext requests. Topics specify what happens when the user clicks on or selects an object. Once the user links topic to screen object, the object will act according to its defined behavior. A special topic named mark can be defined as a "catch all" topic for a group of hypertext topic that behave in a similar manner. This means that if a topic with the same name as the hypertext selected can not be found, the topic named mark is called in its place. If mark is found, the hypertext phrase selected is passed to it as a parameter, otherwise a message will appear that says no more information is available.

2. User Interaction

One of the advantages of using a computer is that we can gather information from the user. Through the knowledge base, the designer communicates to the user, and,
can also provide a means for the user to respond. Like in real conversation, this response influences the subsequent direction of the exchange. KnowledgePro let users use many different screen objects such as buttons, check boxes, list boxes, radio buttons, edit lines, edit boxes, scroll bar etc., that can be used to accomplished a desired conversation. In other word, KnowledgePro includes the ability to create every kind of control available in the Windows environment. For example, edit lines are used for getting values from the user, and created using edit_line command. KnowledgePro provides many different types of screen objects. Each one has its own characteristics making it suitable for certain types of information.

Any word, phrase or screen object can be linked to a KnowledgePro topic. This lets us build hypertext application with flexibility and power. By knowing which screen objects to select for which operations, how screen objects operate, how to arrange the objects in uncluttered, how to make visually pleasing display, we can create an effective visual interface application.

3. Some Tools Provided

Effective user interface and the communication of knowledge are becoming more and more important as computers, applications and users needs all increase in complexity. KnowledgePro(Windows) is provided by tools that lets the designer and the user communicate with each other about the user's needs, the resources available and the task at hand as conversation were taking place. Some tools provided by KnowledgePro Windows are the following:
• The KnowledgePro Editor that lets the users arrange edit windows, edit text, make backup, compile and execute an open Knowledge base file.

• Debugger that lets the users trace the program execution, list topics calls in a knowledge base, evaluate a knowledge base, inspect the running knowledge base with debug topics.

• Dynamic Data Exchange(DDE) for communicating with another window application.

• Design Tools that lets the users create, move and resize windows object in a window, generate the KnowledgePro code and copy to their application.

• Dynamic Link Libraries(DLL) that lets the users run external DOS program and extend the environment.
III. DESIGN AND IMPLEMENTATION

A. PROBLEM STATEMENT

Traditional approaches to database-system design and implementation involve text-oriented data access with their inherent lack of flexibility and extensibility. An alternative to the traditional approach to database-system design and implementation is visual interfaces. How does visual interface software effectively support data manipulation in a database system? What are the benefits of using visual interface compared to regular text-oriented access? To answer these questions we have developed prototype application Emphasis Area Information System (EAIS) using visual interface software.

1. The Current System

The selection of electives by students in the computer science department is a manual process. Currently, a student receives a curriculum package which includes a schedule of the required courses for the final five quarters. A short description of the four emphasis areas available along with the required and the optional electives necessary to fulfill the requirements for the respective emphasis areas. When the electives are offered, the student fulfill the requirements of at least one emphasis area. The current system involves excessive administrative effort on the part of the curriculum staff and the student.

2. The Proposed System

To provide a automated database system which will consist of the required and optional electives for each emphasis area enabling Computer Science personnel to
select electives from this interactive scheduling program. This system will support Computer Science students; the Academic Associate; the Curriculum Officer as well as the Registrar. It will enable the user to view the curriculum requirements, and the elective requirements to supports various emphasis areas.

3. The Design Methodology

The first step in designing a visual interface is to decide what the interface is meant to accomplish. We use a prototyping approach for developing and implementing EAIS. In this approach, we initially develop a conceptual design for implementation of EAIS. Figure 3.1 illustrates the Data Flow Diagram of our system. We then work on
elements of the functional design and dialog style. Finally, the prototyping tool software (KnowledgePro) can be used to develop and create screens or reports according to a dialog style prototype. The reason of using the prototyping approach in our system is to emphasize on speedy implementation and speedy modifiability.

4. Design Considerations

In our system, we apply a number of design principles to help ensure good human factors engineering in a design. They are to be consistent, provide feedback, minimize error possibilities, provide error recovery, accommodate multiple skill level, and minimize memorization. These and other principles are discussed more fully in (Morland 1983, Foley 1987, Shneiderman 1987, Mayhew 1990, Wu 1988).

B. THE GOAL OF IMPLEMENTATION

To study the effectiveness of developing visual user interface application using software development tools, we present the experience of developing a simple visual interface database application using toolkit KnowledgePro(Windows). The goal of the implementation is to show how easy and what are the benefits of using KnowledgePro (Windows) to develop visual user interface of Emphasis Are Elective Information System.

C. THE EMPHASIS AREA INFORMATION SYSTEM

1. The Object of EAIS

There are five objects in our system, Course, Quarter, Emphasis, Elective and Student. The relationship of the objects of the system is shown in Figure 3.2.
a. Course Object

The Course Object is established by Registrar. The properties of the Course Object consists Course Number, Course name, time slot for lecture and laboratory and course description.

![Diagram of course object relationships]

Figure 3.2 The Relational Diagram

b. Emphasis Object

The Emphasis Object is established by the Academic Associate and various sponsor, to concentrate on specific area within Computer Science. The properties of the Emphasis Object include the name of the emphasis area, a description of the
purpose of the emphasis area and a listing of elective courses that will fulfill the emphasis area. The elective course consists of the Required Elective and Optional Elective.

c. Elective Object

This Elective Object is specified by the Curriculum sponsor via Academic Associate and is outlined in the Naval Postgraduate School Course Catalog 1991. The properties of the Elective Object consists of the required course number, emphasis number and the elective type.

d. Quarter Object

The Registrar provide the Tentative Course Offering booklet which contains information about the expected course offering for the next year at Naval Postgraduate School. The Quarter Object is the subset of that listing which constants the courses that fulfill the requirements of the various emphasis areas extracted from the Registrar’s Tentative Course Offering booklet. This properties of the Quarter Offering object includes the quarter name, course number, course name, when the course is projected to be offered in the next academic year.

e. Student Object

The Student Object contains a student academic information. This information is provided by the student. The properties of Student Academic Information include student’s name, rank, section, selected emphasis area, selected courses, taken courses.
2. Application(functional) Requirements

The EAIS is supported by the database which consists of the objects described in the preceding section. The system also interfaces with the external entities (terminators) in reaching decision on which the electives being requested will meet both the emphasis area requirements and the course scheduling constraints. The terminators that interface with the system include the Academic Associate, the Curricular Officer, the Registrar and the student user. The interfaces between the various terminators and the system are detailed below:

   a. Academic Associate

   The Academic Associate is responsible for:
   • representing the interests of the sponsoring activities for the curriculum.
   • providing the required courses for successful completion of the curriculum.
   • determining the requirements for the four emphasis areas and providing a list of required and optional electives that will fulfill them.

   The course requirements data provided by the Academic Associate are entered into a database and accessed by the system to support end user requirements. Modification of either the curriculum requirements or the Emphasis Area requirements will be conducted by the Curricular Officer at the direction of Academic Associate. Academic Associate receives the final report from the system and validates the request prior to its entry into the curriculum database.

   b. The Registrar

   The Registrar provides the Tentative Course Offering updated per
quarterly for Naval Postgraduate School from which the subset Emphasis Area Course Offering Object is extracted. The Emphasis Area Course Offering will be created and entered into database by Curricular Officer. The Registrar receives final report as soon as it has been entered into the curriculum database.

c. The Curricular Officer

The Curricular Officer will update Emphasis Area Course Offering Object as Registrar modifies the annual course offering listing for Naval Postgraduate School. Additionally, he modifies the Emphasis Area Object and the schedule as directed by the Academic Associate. The Curricular Officer receives the final report and has it entered into the curriculum database.

d. The Student

The student is primary interactive user of the system. The student enters initial data for the final report (Student name, rank and section), and the interacts with the system to complete the final report. The Student selects an emphasis area and proceeds to select the quarter he is interested in. The system will generate a listing of the Computer Science core courses that the student will be required to take during that quarter. The system also presents a listing of all elective that are contained in the specified emphasis area that are offered during the quarter that is being viewed.

The student has the option to view additional information about:

- the elective he is interested in, or
- he may enter the elective into a tentative final report format, or
- he may select a different quarter/ emphasis area for viewing.
Once the student has created a tentative final report he has the option of re-entering the system to modify the report or printing the final report. Whenever the final report is created, the student signs the report and forwards it via the Academic Associate to the Curricular Officer and it is eventually entered into Curriculum database.

3. Internal Processes

The internal processes for the system include initial data entry and updating mechanisms for the database in the system. In the previous section we see that EAIS has five data object. Every data object is stored as text file namely Emphasis.txt, Quarter.txt,
Figure 3.4 The Main Menu

Elective.txt, Course.txt and Student.txt. Because KnowledgePro only supports text file. To perform updating and querying a database, we implemented the list structure supported by KnowledgePro. These mechanisms can be done by first reading the data into lists. We then manipulate the data using list operations to get the desired result.

In our system, we use the action/object strategy in structuring hierarchy (see figure-3.3). With the action/object strategy, the highest level menu (main menu) begins with a list of action menus. When the user selects on an action, lower level menus will pick up an object on which to perform the action. Menu selections are attractive because they can eliminate training and memorization of complex command sequence. We wrote the menu items using familiar terminology, so it helps the user select an item easily.
Menus serve the purpose of showing the options the user can choose.

The main menu (figure 3.4) consists of the Exit and Help pull-down menu options, the Query Database option and the Database Management option. The Exit option ends the main menu session. We use three different methods to end the session. Go to the previous session, first we select the Exit option and we then select the Previous_Menu option. To exit the system, first we select the Close option from the control menu. Secondly, by selecting the Quit_the_system option from the Exit pull-down menu option. This means that the system provides a way to accommodate user of multiple skill levels. The Help option provides information to the user about the main menu choices. During human-computer interaction, the Help option can minimize error possibilities. When the user selects the Query Database option, the Query Database module promptly appears on the screen. This module is used for querying the database and generating the reports (see figure 3.5). Likewise, the Database Management module will appear on the screen as soon as the user selects the Management Database option (figure 3.14).

4. The Query Database Module

The Query Database module consists of button options. There are the Emphasis_Areas, the Elective Offered, the Course Elective, the Option Area and Course Selection and the Generate Courses selection options.

a. Query Emphasis Areas

This module is for querying the Emphasis area. To accomplish this job, we first select the Emphasis_Area pull-down menu option. We then select one of the track
options. For instance, when we select the *Military Data Processing* option, the system will display a window frame shown in figure 3.6.

**b. Query Elective Courses**

The Query Elective module will produce the list of elective courses associated with given the emphasis area (see figure 3.7). Whenever the user want to know more information about specific course, then he or she can select the desired course from the lists. The system will give a course information shown in figure 3.8.

**c. Query Elective Offered**

The Elective Offered module gives a list of the elective courses offered in given specific quarter. For example, when we select the *Summer* option from the *Quarter_Name* pull-down menu and the *91* from the *Year* pull-down menu, the system...
Figure 3.6 The Query Emphasis Area

**d. Option Area and Course Selection**

This module gives the final product of the system is report entitled "COMPUTER SCIENCE(368) EMPHASIS AREA DECLARATION AND COURSE SELECTION". It is the recommended courses suggested by the system. This report consists information about student's name and rank, class section, the emphasis area selected, the emphasis area electives requested and alternate elective requested for the final five quarters of the curriculum. The report is submitted by the student and is forwarded the Academic Associate and Curricular Officer and is entered in the Curricular Database to generate Schedule requests from Registrar's Office (see figure 3.10 and figure 3.11).

![Figure 3.10 The Elective Course Selection (frame 1)](image-url)
e. Generate Course Selection

It is possible that the selected courses are not offered in the quarter the
user selects. In figure 3.11 the course number cs4520 will not be offered in Fall 91. The report also says that the student first should take the prerequisite course for cs4322. The Generate Elective Course selection module provides a modification mechanisms to change the undesired courses. There are several steps to update the undesired course selection shown in figure 3.11. First we select the Fall option from the Quarter_Name pull-down menu. We then select the student name from the student identification list. Finally we select the 91 option from the Year pull-down menu. The system will produce a window frame shown in figure 3.12. Instead of choosing cs4520, we replace it with cs3320. If we commit by clicking on the Ok button, the result will appear on the screen (see figure 3.13).
5. Database Management Module

As we stated before that the main menu consists of the Query Database and the Management Database. The Query Database has already been discussed, and now let we discuss the Management Database. There are five button options: Course, Emphasis, Elective, Quarter and Student options (see figure 3.14). By pointing and clicking the mouse to one of the buttons such as Course, the system will directly manipulate the Course Object as a result a sub menu for the Course Object will be displayed on the screen. Each sub menu of Management Database consists of three button options. These options are for adding new data, deleting data and updating the data associated with the file that stated in the button selection. By having the similar options in every sub menu
and in the same order, this helps the user and reduces errors and training time.

In this section, for simplicity, we only discuss one example of Management Database, which is the Course Object. When we select the Course button of the Management Database menu, then it will display the sub menu of Management Course Data Object on the screen (see figure 3.15). This menu provides three button options: Update the Course, Delete the Course and Add the Course. These options are for updating mechanisms. The Exit option is for ending this session and the Help options is for getting information about the Course Object module. Now let us select Update the Course option to change the current record in the Database.

The window frame shown in figure 3.16, is the result given after clicking the
Update the Course option. Now, the user can select the course to be updated from the list-box with the list of courses. Using a single click on the course followed by clicking...
Figure 3.18 Updating The Course (frame 3)

on the Ok button or using the double clicking the user can update directly. The system immediately gives a response by displaying detailed information of the record selected. Figure 3.17 depicts overlap windows, where the user can edit and modify the data from current windows. This menu provides Update button and Cancel button which allows to the user to process or cancel the operation. After the user finish updating the selected course, a message window will be displayed. This message window gives the user options to continue updating Course files or not (see figure 3.18). Deletion and addition can be done in the same manner.
6. Coding the Programs

As we stated earlier, that a program created by the user in the KnowledgePro environment is called Knowledge base. Through the Knowledge base, the system communicate to the user and, can also provide a way for the user to respond. In other words, all functions of the EAIS are controlled by the Knowledge bases interactively.

There are a total of eleven Knowledge bases in the system. Each controls the execution of one or more modules. Table 3.1 depicts the Knowledge bases and functionalities used in the system.

Through our experience of implementing a EAIS application using a software development tool KnowledgePro(Windows), we found some advantages as well as disadvantages. In the next chapter we will try to evaluate the development process of the EAIS using KnowledgePro.
IV. EVALUATION

In the previous three chapters, we have described some motivation and background of the thesis, and implementation of the EAIS. Now we will evaluate the application development process of the EAIS using toolkit KnowledgePro(Windows). We organize this chapter into three sections. Section A will discuss the category of KnowledgePro (Windows). Based on our experience, section B will discuss the advantages and disadvantages of using KnowledgePro. The last section will look at the comparison between KnowledgePro and Toolbook.

A. THE VISUAL INTERFACE CATEGORY OF KNOWLEDGEPRO

As we mentioned earlier, we know that visual programming growing in two major directions. In one direction, pointing devices and graphical techniques are used to obtain the visual environments for program development and execution; for software design; and for information retrieval. They all provide a visual environment which captures a new way for humans to interact with the computer. In the another direction, languages are designed to handle visual information; to support visual interaction; and to program with visual expression. Programming languages that fall into this category support a way in terms of an approach to the language aspects of the programming process. Table 4.1 shows the trends of the current visual programming.

We have briefly examined these different aspects of visual programming. The purpose of the classification is to sharpen our understanding of visual programming by
focusing on the functional distinctions; and to have the distinctions among the different categories of visual programming. To classify whether KnowledgePro is visual programming or not, is the consideration of graphical representations must be used in the programming process. Now let we discuss the aspects of KnowledgePro that can be applied by visual programming.

Some capabilities supported by KnowledgePro include linking screen objects to topics, displaying a picture, handling events, getting information from the user, and temporarily halting topic execution.

1. Linking screen objects to topics

In the Main Menu (figure 3.4), the two options on the screen are located on buttons. There are the Query Database and the Management Database buttons. A button is used to triggered an action. When a button is selected something happens immediately. These are both examples of screen objects. The highlight is moved among screen objects
by pressing TAB or SHIFT TAB or by clicking on an object with the mouse.

The command that creates the button shows how an event topic is assigned to screen object.

button (QUERY DATABASE, QueryDatabase, 18, 10, 30).

The first parameter defines the name on the button, the second defines the event topic and the final parameters set the column, row and length where the button is displayed. So when an event topic is called it is passed these piece of information : information about the event; the name of the event; and the handle of the current screen object. Something called a select_event occurs as the default event for s button. When the select_event occurs, the button’s event topic, QueryDatabase, is immediately called.

2. Displaying a picture

There two different types of graphics supported by KnowledgePro. Each of these is used for a different function. The first type is Icons. Icons are images associated with windows. The second one is bitmaps. Bitmaps are used for displaying pictures.

Bitmaps can be created using Zsoft’s PC Paintbrush for Windows. To load a bitmap, we use load_bitmap command. The following is an example command to load a bitmap that returns a bitmap photo :

photo is load_bitmap ('PICTURE.BMP').

We then may display, print and delete using the commands :

bitmap (?photo).

print ('#g',?photo).

delete_bitmap (?photo).
In the same way, the icons can be created using software called ICOEDIT. For instance, to load the icon LOGO.ICO, display it at column 4 row 5 of the current window and delete an icon, we use the following commands:

- `logo is load_icon ('LOGO.ICO')`.
- `icon (?logo, 4, 5)`.
- `delete_icon (?logo)`.

3. Handling events

We have mentioned in chapter II, that KnowledgePro is an event driven language. When we view a program as a communication between the system and the user, this means that via the system the designer talks to the user and then waits for the user to talk back. When the user talks back, an event occurs. When we create a screen object, we specify whether we want it to handle events and which events we want it to recognize. This is done by specifying an event handling topic. Event handling topic is called whenever one of the specified events occurs while the focus is on the particular object.

To make it clearer, let’s look at the following example.

```
wl is window(WindowTopic,20,3,50,10,title,,,[move_event,close_event]).

topic WindowTopic (info,event,handle).

do (?event).

   topic move_event.
       column is first (?info).
       row is last (?info).

end.
```
topic close_event.

WindowTopic is true.

end.

end.

When window w1 was created we specified that move_event and close_event should be recognized. When one of these events occurs, then WindowTopic, the event topic defined in the window command is called. When the user moves w1 a move_event occurs.

4. Getting information from the user

During visual user interface development, it is important that the selection of screen objects are the one best suited for the information being gathered. KnowledgePro provides edit objects that let the designer gather information such as name, class, rank quickly and easily.

The commands or functions to create edit objects include:

• edit_line is used for entering a single line of data
• edit_box is used for entering multiple lines in a dialog window
• edit_window opens independent editing window
• edit_file opens independent window with a File, Edit and Search menu

The user can select one or more items from a list of options using

• list boxes, check boxes or radio buttons that let the user selects one or more items
• hyper-regions used for selecting values using pictures

KnowledgePro provides many types of screen objects. It makes the designer
selects among them to make the best use of system environment. Additionally, each
screen object has the same behavior make it very obvious to the user what has been
selected and they provide visually attractive way to make options apparent.

5. Temporarily halting topic execution

There are times when we need to temporarily halt the execution of the
commands. This can be done with wait command. Generally, the use of wait is to halt the
system to wait for the user input as the following example:

    window ( ).

    text ('Welcome to the #mNaval Postgraduate School#m').

    wait ( continue, 5 ).

A window is opened and a welcoming message is displayed. wait then stops
executing the system until five seconds have expired or until the user select the continue
button in the wait window, whichever come first. When the user select the hypertext,
topic Naval Postgraduate School is called.

KnowledgePro may be classified as a language that can be used to create, define,
and manipulate graphical representation. The objectives of developing KnowledgePro are
motivated by the need to have easy-to-use languages for the manipulation and querying
of graphical data. KnowledgePro provides a way to deal with all possible sequences by
the user with the input devices. This means that KnowledgePro is a user interface
development tool that exploits the concurrency among multiple interaction devices such
as mice, buttons, list boxes, radio buttons, and keyboards. KnowledgePro provides the
capability to create every kind of control available in the windows environment, it makes for graceful interaction between the user and the computer.

Based on the capabilities of KnowledgePro, we believe that KnowledgePro focus is on language aspects for a good visual user interface. As mentioned before, visual languages can be classified into language for handling visual information, language for supporting visual interaction, or language for programming with visual expression. KnowledgePro falls into the second category, Languages for Supporting Visual Interaction.

B. THE ADVANTAGES AND DISADVANTAGES OF USING KNOWLEDGEPRO

The goal of this thesis is to study the effectiveness of a visual interface. To accomplish the goal we have implemented the EAIS using toolkit KnowledgePro. Through our experience we have found some advantages and disadvantages of using KnowledgePro.

1. Advantages

As we mentioned before that the decreasing cost of computing, coupled with the widespread use of personal computers, has acted as a catalyst for more application. By necessity, end user-computing is becoming a major trend.

KnowledgePro offers characteristics to enhance the end-user computing, reach a broader personnel base of programmer; and increase their productivity. Some of these characteristics are: ease of learning; ease of use; and modularity.
a. Ease of Learning

KnowledgePro comes with a single, large manual that includes tutorial, reference, and appendix sections. It uses a multiple document interface and also provides a large application hypertext-based on line help that let users work on more than one application at a time. If command's errors are found, we can directly call on line help without quitting from current application. KnowledgePro also includes the complete files for KnowledgePro tools, such as FONT.CKB and DESIGN.CKB which serve as excellent references for experience programmers. From our experience of using KnowledgePro in the EAIS implementation, we easily learn and implement it. Reducing learning time can increase productivity and number of people who can program.

b. Ease of Use

Traditionally, computer programming languages that were developed in the 1960s, 1970s and early 1980s, such as FORTRAN, COBOL, ALGOL, PASCAL, ADA, or C were designed for use in the non-interactive computer environment. Programmers would compose hundreds or thousands of lines of code, carefully check them over, and then compile or interpret the code by the computer to produce a desired result. Creating a visual interface in these traditional approaches requires unacceptable amount of time to design, code, test and maintain the software.

KnowledgePro is a mainstream object-oriented Windows development system that offers additional hypertext and expert system tool feature to enhance the visual user interface. KnowledgePro works as integrated development under Windows. The KnowledgePro main window includes commands for maintaining, compiling and
running files; searching and replacing text in edit window; running the application; clearing the current application; debugging the application in memory; and a switch for setting a slew of KnowledgePro environment options. The main window also offers an on-line context-sensitive hypertext help function.

The KnowLedgePro language is surprisingly compact for such a powerful system. It contains few syntax rules, so we can be verbose in our coding, without destroying the meaning of the topic or encountering an error. For manipulating data, KnowledgePro provides string and financial operations as well as facilities for performing set operations against lists. KnowledgePro includes the source code for the help system application. Creating and manipulation push buttons; radio buttons; check, list and edit boxes; and hypertext region is easy. It also provides several tools and their source code, to make it easier for users to design and build an application. FONT.CKB and DESIGN.CKB are the most important function as interactive code generation tools to emphasize speed on implementation.

The debugger includes several tools, including a window for displaying application topics. We can use it to browse a topic’s values, commands and properties, much like an object browser in Smalltalk. It also provides a command to evaluate the text of the selected edit window; a command to compile and execute the code immediately and a command to trace each step as the application is executed. The Calls window displays a list of topics that our application has called but not yet executed.

KnowledgePro offers solid and useable development tools that run very quickly and cleanly. This is one Windows development environment tool that offers the
ease of use, the ease of learning and extensibility for both power users and developers.

c. Modularity

The principles of software engineering recommend writing code in small, self-contained units, called modules. Modularization is the process of dividing a task into subtasks. Each module performs a separate, independent part of task. Modularity offers advantages for program development, as well as software maintenance.

A knowledge base is a collection of topics. Topic strongly supports modularity. When KnowledgePro is loaded, only one topic, named 'main, exists. If we compile a knowledge base, the commands in the knowledge base become associated with 'main; topics defined in the knowledge base become subtopics of 'main. Topics can also be subtopics of other topics. This is called nesting. There are several advantages to writing a program as a series of topics.

- Understandability. The topic structure groups together related functions and hides the details of their implementation. This makes debugging easier and the knowledge base more understandable.

- Maintainability. If a function is implemented as a single topic, the topic can be replaced with a revised one, if necessary. The new topic may be needed due to a change in requirement or the environment.

- Reusability. Topics developed for one purpose can often be reused in other programs. Reuse of correct, existing topics can significantly reduce the difficulty of programming and testing.
2. Disadvantages

   a. Speed

   KnowledgePro offers the ease of use by providing many kinds of different screen objects such as push buttons, radio buttons, check boxes, edit boxes, list boxes, edit line and hypertext regions. The designer can build user interfaces easily. However, creating and manipulating the screen objects, make the system runs slowly. From our experience, the primary difficulty of implementing the EAIS using KnowledgePro is achieving quick navigation through the system. This lack of speed is due to the large overhead involved in processing screen objects by the Central Processing Unit.

   The solution of this problem is to invest in hardware that speeds up graphics processing or provide the system with other toolkits such as KnowledgePro Math Toolkit, or KnowledgePro Graphics Toolkits.

   b. Error Handling and Compiling

   When we compile a knowledge base with many errors, KnowledgePro will display an error at a time on window screen. The system wait for the response of the user to continue the operation or cancel. By displaying one error at a time on the screen, the system needs more time and is not attractive to the novice programmers and end-users. Lets us consider the following knowledge base:

   topic first.

   list is [A, B, C].
   item1 is first (?list ).

   end.
When we compile it, we do not have any errors. But when we run this program, the result is an infinite loop because it has the same name as a function which is used in a command for the topic. Instead of calling the function first, the knowledge base topic first is recursively called forever.

c. Design Tools lacking

Despite the powerful language and functions, we found KnowledgePro's application design tools lacking. The tools include a simple font generator and an interface design tool. The interface design lets us the user create, position, and resize Windows objects in a window, generate the KnowledgePro code to create and manipulate them, and copy the code via the clipboard, to the user application. The font generator lets the user configure custom fonts from the available windows fonts.

The tools are rather limited and operate in nonstandard way. For example, most Graphical User Interface design tools lets the user use the mouse to put the object into position in the interface. With the KnowledgePro's interface design tool, when we click where we want the object to be, then the object jumps to where we clicked. Further, we have to use keyboard to resize an object because the mouse does not support resizing.

C. COMPARATIVE STUDY BETWEEN TOOLBOOK AND KNOWLEDGEPRO

As we stated before, that Toolbook and KnowledgePro are software development tools for Windows 3.0. The implementation of a sample application using KnowledgePro has already been discussed along with it's advantages and disadvantages. In this section,
we try to compare both tools to have a better understanding for software development tools.

1. **ToolBook**

Toolbook greets the user with its Book-shelf front end. A "book of books" showing icons for the available Toolbook applications. The user is off to a quick start with the following applications: the DayBook information manager; the ToolBook/DBASE Exchange; a graphics front end to DBASE files; and the Quick Tour. Both the ToolBook Quick Tour and the on-line help give the user easy access to any part of the system. This means that ToolBook offers access to the graphic power and intertasking linkage of the Windows environment. Support for basic Windows features of ToolBook and the ease of learning to use development tools are better in Toolbook than in KnowledgePro. ToolBook is an active environment, sending a constant stream of messages to its objects. This allows the designer to easily alert the user to problem areas on screen. A feature of growing importance in fully graphic applications designer alerts. ToolBook's limit on "nested handlers" forces a recursive benchmark to be written in an interactive style. In contrast, KnowledgePro accepted recursive benchmarks without rewriting them.

2. **KnowledgePro**

KnowledgePro works with "knowledge bases" in contrast with ToolBook's pages of books. KnowledgePro supports hypertext feature that can be clicked upon by a mouse to produce some programmed action. By making on screen text an active component of the interface, designers can build a single software object that serves as
both code and data. The result is extraordinary development productivity. Like ToolBook, KnowledgePro is an active environment in which objects receive a stream of messages as the user takes various actions. KnowledgePro is also similar to ToolBook in the way that individual objects are given handlers for those events that the programmer considers relevant to each object.

KnowledgePro is more responsive than ToolBook, with interactive touches such as editor windows that scroll interactively as the user drags the elevator box at the right side of the window. KnowledgePro offers full topic subclassing with multiple inheritance, a feature that distinguishes it from ToolBook. It’s support for Windows objects is much richer than ToolBook’s. KnowledgePro enables developers to produce Windows programs that offer broader functionality than those created in ToolBook.
V. CONCLUSIONS

Traditionally, the design and implementation of conventional database systems involve text oriented data access with their inherent lack of modularity, extensibility and modifiability. An alternative to this traditional approach is using visual interfaces for the design and implementation of databases. This alternative approach involves using software development tools (toolkits) to ensure modularity, extensibility and modifiability. To study the effectiveness of using visual interfaces, we have designed and implemented a sample application named The Emphasis Area Information System (EAIS) using KnowledgePro, a tool for rapid application under Windows.

An interactive user interface was implemented for the EAIS using KnowledgePro. An evaluation of our implementation indicates that designing an interactive user interface using visual interfaces is easier than designing a user interface using the traditional approach. KnowledgePro falls into the language for supporting visual interaction. KnowledgePro supports interactive design tools and easy-to-learn commands which extremely facilitates using and learning the system. Underlying this easy-to-learn environment is a powerful symbolic language called the topic. Topics are very highly support modularity, extensibility and modifiability which increase on speedy the system development.

The primary difficulty of the implementation of the EAIS using KnowledgePro is achieving quick navigation through the system. This lack of speed is due to the large
overhead involved in processing screen objects by the Central Processing Unit. The solution of this problem is to invest in hardware that expedites graphics processing or provide the system with other toolkits such as KnowledgePro Math Toolkit, or KnowledgePro Graphics Toolkits.

There are still some issues that need to be considered for future research. Some of these issues are the utilizing new features to Windows including:

- The expert system tool features to enhance the friendly user interface. The expert system capabilities enable the application designer to built in expert system rules that allow to be tailored to a user’s level of expertise.

- Dynamic Data Exchange (DDE) as a method for applications that run under the Microsoft Windows to communicate directly with one another.

- Dynamic Link Library (DLL) is a separate file containing functions which can be called by the programs to perform specific jobs.

Using these features would increase efficiency in designing and implementing visual interface to database systems while decreasing the time.
